1. March 16 Meeting

Yahoo group: DAWG-HSMM
Date: 2004-03-16 06:21:36 UTC
From: J. Beadles
Topic: 1 Message: 1

All,

The next meeting will be:
Tuesday, March 16
Collin County Community College
Spring Creek Campus
Classroom J-133 (south end of the bldg)
7pm to 10pm

To get to the Collin County Community College, take I-75 (Central Expressway) to Plano to the Spring Creek Exit. Turn East, drive to Jupiter Road. Turn right (south) on Jupter. Turn left into the campus entrance (next to the baseball diamond). The Campus is one large building divided into sections. The J section is in the south end of the building, and we assume that the room is on the first floor.

Agenda:

1. Merging with the North Texas Microwave Society
2. May 08 Richardson "Wild Ride" bike ride
3. NT5NT Access Point
4. Setting up training materials

2. Need some help.

All,
Now that my laptop has decided to quit working on the PCMCIA port (my LAN and 802), it looks like I need to replace it. So, does anyone know of locations I might find an "economical" used laptop. Any and all suggestions will be greatly appreciated.

Thanks & 73, John - N5TIM

John,

I know I've seen used laptops all over the place, but hard to narrow
down a specific. If I had to point to one, I'd say run over
to "Resource Concepts" on Frankford over near 35. They refurbish
used Dell laptops, and usually have a wide range of models and prices
and have most of the support parts (power supplies, CD-Roms, etc.).

4. 2.4G test equipment

Yahoo group: DAWG-HSMM

From: J. Beadles
Topic: 5 Message: 7

Argh, I should have said...

The access point testing session be held starting at 6pm Saturday, March 20. We will meet at the base of the Nortel Building at 6 and start driving at 6:20pm. The address of the Nortel building is:

2221 Lakeside Parkway, Richardson, TX.
To get to the building:

1. Take Central Expressway to the Campbell Road exit in Richardson.
2. Get on the northbound access road
3. Turn right onto Lakeside Parkway (the first right).
4. There is a parking lot at the base of the building.
5. The building is a 16 story tall bldg and has a distinctive curve to it.

Operations and talk in will be on the NT5NT repeater, 443.325+, pl 110.9.

Please bring area maps. The AP is a repackaged Linksys WAP11 connected to a 16 db antenna which is facing roughly east north east toward Wiley. I have been able to hit the access point from the intersection of Greenville and Plano Road with a standard Orinoco PCCard client. Much beyond that I don't know what we will see. I was able to get plenty of signal with a 24 db antenna from the intersection of Lookout and 190, a distance of approx. 3.8 mi.

I'm thinking we will practice linking through the AP and driving the coverage area using Netstumbler or any other survey tools you might bring.

8. MICROWAVE UPDATE 2004

Yahoo group: DAWG-HSMM
Date: 2004-03-22 00:41:32 UTC
From: n5pyk
Topic: 8 Message: 8

From Joe: This event only usually shows up in the DFW area once a decade or so. Don't miss this opportunity to really learn some neat stuff about microwave.

The North Texas Microwave Society is the proud sponsor of Microwave Update 2004 being held in Dallas, Texas on October 15 and 16, 2004. The conference will be held at the beautiful Harvey Hotel DFW Airport, just minutes from the north end of DFW Airport.

Microwave Update is the premier technical conference for the amateur radio operator interested in pursuing activities on the frequencies above 900 MHz. This years event will host technical presentations on both Friday and Saturday from your friends and peers pursuing projects in the microwave bands. This will be an ideal event for you to meet with and talk to your fellow microwave hams from around the world. If you are interested in presenting a paper at the conference, please let one of us know. As usual, the ARRL will be publishing the conference proceedings.

A tune-up clinic consisting of noise figure and network analysis equipment to 50 GHz will be conducted through out the event. The usual surplus tour hosted by the ultimate junk hound, Kent Britain, WA5VJB, will be conducted on Thursday. A Friday night flea market for the microwaver will provide the opportunity to both buy and sell. The conference will end with a fabulous Saturday night banquet to wrap up the event. The prize table will offer both ham and non-ham prizes.

For the ladies, a fun weekend of exploring Dallas/Ft. Worth antique shops, restaurants, old villages and much more. We are also looking at the possibility of craft demonstrations and classes plus a possible wine tasting tour for the women only!

For those that would like to spend some extra time in the DFW area, there are plenty of attractions to take in, including the Ft. Worth Stock Yards, Billy Bob's, Dallas West End, Dallas Arboretum, Kennedy museum, Gilley's in downtown Dallas, Six Flags over Texas, the Meyerson Center and numerous great golf courses in the DFW area.

The Harvey Hotel is within minutes of the DFW airport and provides exceptional conference facilities. The hotel offers free shuttle service to and from the DFW airport. Due to the popularity of the hotel for corporate functions during the week, the nightly rate for Thursday night is $89.00 plus taxes and $65.00 plus taxes per night for both Friday and Saturday nights. These rates are considerably reduced from the usual corporate rates, so we are real fortunate to be able to take advantage of the Harvey Hotel facilities for

Microwave Update.

The Harvey Hotel will provide on-line registration. Go to www.dfwairport.harveyhotels.com/ and click the Reservations box (the Boeing 747 picture). Once on the Reservations page, enter the dates you will be staying and 10606 in the Group/Event ID box. Scroll to the bottom of the page and click the Begin Search button. On the next information page, click the View Rates button. Then click Detail to see the rates for the following nights. These are the Microwave Update discounted room rates. Failure to mention Microwave Update will make it difficult for us to get the discounts on the meeting rooms which are based on the number of room nights that we book for our attendees. If you have not already picked the room type then click the Select button next to the desired room type. On the next page, Click-check the box "Accept Guarantee/Deposit & Cancellation Policy" and click Enter Guest Info button. Fill in your personal information and click the Complete Reservation button. It's that easy! For those wishing to call the Harvey Hotel reservations direct, the telephone number is 972-929-4500. Please mention Microwave Update.

As with most Microwave Updates, a test equipment table will be available to help tune up your equipment. Noise figure measurement capability will cover VHF through 47 GHz. This will be great for measuring those new microwave LNA's and converters. Network analysis capability will cover frequencies to 50 GHz. Tuning up filters and finding out the bandwidth of that unknown amplifier will be easy with the network analyzer. Spectrum analysis will cover frequencies to 26.5 GHz allowing one to take a look at the spectral output of a local oscillator. The spectrum analyzer also has a special phase noise module to measure and record the phase noise of your favorite LO (s). Power supplies will be available for your equipment. However, bring your special tools for opening and tuning your projects. Antenna gain measuring will be available at frequencies from 902 MHz through 47 GHz. There is a possibility that we will be able to push our equipment limits to 74 GHz, however, if there is anyone that would like to bring signal sources, noise sources, etc for 74 GHz please let us know.

Kent's world famous surplus and electronic store tour on Thursday will visit such places as TESCO, Texas Towers, AlTex, Tanner Electronics, several small parts stores, Fry's Electronics just to name a few.

Also, check out the NTMS website www.ntms.org and the Microwave Update website www.microwaveupdate.org for further information about MUD 2004.

This conference will be the microwave event for 2004. Don't miss it! Come join the fun and camaraderie in Big-D.

9. 802.11 Testing Activity Report

Yahoo group: DAWG-HSMM
Date: 2004-03-22 18:36:07 UTC
From: Joe - N5PYK
Topic: 9 Message: 9

I've placed an activity report on the NTMS web site under Activity reports www.ntms.org. Contributions made by both N5OOM (John) and myself. It also includes a map.

Please take a few moments and read over it. There are some findings that may be of use to some of you.

Also, I've started user-interface work for a instant messenger type client for amateur radio that we can use to send messages, files, know who is online, etc. If you have ideas for that, just let me know. Send it to n5pyk @ arrl. net (yes remove the extra spaces in the address).

Interestingly enough, Did a comparison with radio mobile.

Using the following network conditions
Freq Min 2400
Freq Max 2450
Surface Refractivity 330 (based on weather conditions at 8pm Saturday evening)
Ground conductivity (0.005) S/m (default)
Relative Ground permittivity 15 (default)
Horizontal Polarization
Broadcast variability (75% of situations, locations and time)
Additional loss (0%)
Climate Continental sub-tropical

The model has trouble with antennas really close to the ground (e.g. at 2m).. I used a 4m height on the remote end.

Computed signal strength is -82.5dBm (Really close) for Livonia Park
Signal strength at Home Depot, Wylie -81dBm (worse than observed) perhaps we were getting some enhancement off the stadium???

I did notice that Nortel is below the optical horizon from Livonia Park.
Good thing the K-factor works!

73,
Joe

Now that I asked, here's a list of stuff:

http://www.networkintrusion.co.uk/wireless.htm

And some of the individual links:
http://www.netstumbler.com/

Etherreal is a packet analyzer, lets you see what traffic is coming
over your network.
http://www.ethereal.com/

AirSnare looks nifty. It monitors your network, looking for
unfriendly MAC addresses. If it finds something it doesn't like, it
can fire Etherreal to capture the traffic.

That's pretty nifty, and harkens back to the days of yore when I did microwave path planning. We rarely did over 30 miles on 4 & 6 Ghz, but then we had to design to pretty high reliability standards (no more than x minutes of outage per year) so our design criteria were pretty strict. If you can stand more outage, you can relax your criteria.

Before we started this Yahoo group, KV5E posted this link to an article discussing theoretical maximum 802.11b path lengths:

http://peertech.org/LongShotWiFiTiming

Hi,

Interesting article but should I point out that 1 watt into a 24 dbi antenna puts him in violation of the Part 15 rules for WiFi ?

From my understanding of those rules is to meet the spec he should reduce power by 6 db. That is reducing power by 1 db for ever 3 db over 6 dbi of antenna gain.
(24-6)/3 = 6

Now if that was a Ham Radio link?..

The station I am putting together uses a 1W Hyperlink HA4201 Amp and an old ATV Rx antenna, which I believe to be 24 dbi. Current plans call for improving the feed point with 2-11 Ghz PCB Log Periodic Yagi. One of the WA5VJB designs. The Radio is an Orinoco Gold card. I?ll probably drive this with my Linux Laptop.

Now if I can just get back to Dallas to spend some time in the garage working on these projects.

That's the way to go, to be sure. I really want a couple of Orinoco based APs because they are accepted with the Orinoco cards. Few of the off the shelf devices are, that I know of. Yell when you are back in town, we need to try to set up a link.

Chris,

Link for the Tiny Trak is http://www.tinytrak.com. I'm not sure what cable and link radio you are asking about.

21. WEP hints from KC5QHH

Yahoo group: DAWG-HSMM
Date: 2004-03-31 20:31:51 UTC
From: J. Beadles
Topic: 21 Message: 21

Randy Dunning, KC5QHH sent this in...

Hello John,

Over the weekend I activated WEP on my home 802.11b Wlan. In the process of this wrestling match with WEP Grendel I discovered a problem and a solution that others may profit from. The setup was as follows:

WAP - Belkin 802.11b Wireless Cable/DSL Gateway Router (Part # F5D6231-4)
PC Card - SMC 2532W-B EliteConnect 200 milliWatt 802.11b

Print Server - D-Link DP-311P Wireless Print Server

The problem is that once WEP was activated the Belkin router failed to allow configuration through the web interface over the air (expected if there were problems) AND over wireline (very weird since wire is not supposed to be effected by WEP). So I hard reset the router and tried again. No success. I then hard reset it and turned it off for 24 hours. It then came back up with no problems. Apparently it takes a long time for the Belkin router to assume room temperature.

Every attempt at entering WEP via the ASCII string translation was a dismal failure and required a rather lengthy process to get the Print Server back to WEP off mode. I noticed that the documentation for the Belkin indicated that it was compliant with a "Draft" WEP standard rather than the actual standard. So, the final solution was to use the Belkin interface to enter an ASCII string that I wanted to use as my WEP key. I then copied down the HEX equivalent and added that into my other devices. This worked and the whole network came up. So when ASCII entry fails, try HEX as a last resort.

One other observation: Lose the Belkin Router! The antenna array is not removable and the unit is a tad flakey. Its days are numbered...

Cheers,

RD

23. NTMS Antenna and Tune-up Party

Yahoo group: DAWG-HSMM
Date: 2004-05-03 00:35:48 UTC
From: Douglas Kilgore
Topic: 23 Message: 23

Attn: HSMMers and Wild Ride hams

This Sunday, Apr. 4 at 1:00 PM is the NTMS Antenna and Tune-up Party at WA5VJB Kent Britain's house in Grand Prairie. Look up his QTH on map at www.qrz.com.

Kent is the Antenna columnist for CQ-VHF magazine. He really knows his stuff about antennas and is willing to assist a ham to get every last db of gain from their antennas.

Directions:
Exit I-20 at Great Southwest Parkway
Take I-20 Eastbound access road about 1 mile to Mathew St.
Right turn on Mathew to Vineyard (3rd street)
Left turn on Vineyard and look for antennas on north side of street

This is an excellent time to check out your external 802.11b antennas and measure how much actual gain you get from them. Get them ready for the Wild Ride.

I'll be driving from Richardson if someone wants to carpool.

Doug Kilgore KD5OUG

28. 04 Wild Ride - Wiley Stadium Bridge

Yahoo group: DAWG-HSMM
Date: 2004-04-06 02:01:54 UTC
From: J. Beadles
Topic: 28 Message: 28

All,

It appears that we're going to be able to put a relay station on the press box of Wiley High School Stadium. This hardware will consist of one client bridge pointing back at the Nortel tower, and an access point facing out towards rest stop 2 & 3.

System pics at: http://www.n5oom.org/2004_wild_ride/hsmm/index.htm

Ric furnished one pallete, and I have the bridge part of the system put together. Total cost out of pocket, $2. I screwed a piece of 2"x4" with a Linksys mounting bracket on the pallette, went to the dollar store and got a couple of white dishpans. The dishpan fits over the access point and will be screwed down when we're ready to deploy. Cut a piece of 1-1/4" conduit for a mast. Left it a little long for if we wanted to put a yagi for an APRS relay digi on it.

http://www.n5oom.org/2004_wild_ride/photos/wiley_stadium_bridge/

Next task is to put together a second one for the access point facing out to the east. The two APs will be separated to minimize adjacent channel interference issues, and will be connected together with CAT-5 network cable.

30. Change of Location for Monthly NTMS-HSMM Meeting

Yahoo group: DAWG-HSMM
Date: 2004-04-06 20:25:07 UTC
From: Douglas Kilgore
Topic: 30 Message: 30

The North Texas Microwave Society - High Speed MultiMedia (NTMS-HSMM) group will now hold it's monthly meeting on 3rd Tuesday 6:30pm at Chuck's Hamburgers, 502 Spanish Village Shopping Center, Dallas, TX. This is the NW corner of Coit and Arapaho in North Dallas. In addition to delicious old-fashioned hamburgers, the menu has various sandwiches and salads. Come early and enjoy the food.

The next monthly meeting is Tuesday, Apr. 20, 2004. This is the place to bring those nagging questions about 802.11 and other high speed data formats at 900Mhz and above.

31. 10 GHZ Sprint

Yahoo group: DAWG-HSMM
Date: 2004-04-06 21:31:54 UTC
From: Joe - N5PYK
Topic: 31 Message: 31

Hi all HSMMers.

I'd like to double make sure all of you are aware that the NTMS is holding their annual 10 GHZ Spring Sprint on Saturday, April 24th. I realize that most of you don't have 10 GHz gear, but what we can offer is the opportunity to pair you up with someone who does, do a little roving, make some microwave contacts and get some hand-on experience with setting up links.

We'll probably start off in the North Dallas area where communications can be assured to check that the rigs are working and frequencies are correct. Then, rovers will travel to other parts of the area and make contacts between as many stations as popular. You'll really get a feel for how to point dishes, how to figure out how to aim the right way and where to aim!

I'd really recommend tagging along for this event...it will be experience that will really come in handy with our HSMM work.

If you'd like to be paired up with an experienced 10 GHz Rover, just send me an email to jurecka@...

Details and rules about the contest are available at www.ntms.org

32. 2004 TAPR Digital BASH at Dayton, May 14th

Yahoo group: DAWG-HSMM
Date: 2004-04-07 03:18:51 UTC
From: kr1zan
Topic: 32 Message: 32

The following from John Ackermann N8UR <jra@...>, relayed by
KR1ZAN

Announcing the 2004 TAPR Digital BASH!

What?
An event for the digitally-inclined ham, featuring:
* Buffet dinner
* Keynote Address: "Open Source in the Real World" by John
Ackermann, N8UR
* Informal "Birds of a Feather" gatherings
* Door Prizes!

When?
Friday evening, May 14, 2004
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker, meetings, and door prizes after dinner

Where?
Kohler's Banquet Center, 4548 Presidential Way, Kettering
(39 40.75N, 84 08.43W). From downtown Dayton, take Main Street,
which becomes
Far Hills Ave., south to David Road, then east to Presidential
Way. Turn south
on Presidential Way. Kohler's is on the left about 1/4 mile
south. Maps
available on the TAPR web site (http://www.tapr.org/tapr/dayton,
follow the
link at the bottom of the page), or at the TAPR booth.

How?
Dinner requires advance registration and payment through TAPR.
Tickets will be available at the TAPR booth on Friday, though
we strongly encourage registration <before> Hamvention. The
cost is $28.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and
participate in the meetings, although only those purchasing a
dinner can eat.

To register, contact:
Digital BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399
Phone: 972-671-TAPR (8277)

Fax: 972-671-8716
Internet: tapr@...

Visa/Mastercard Accepted

Who?
PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio, the national leader in digital communication -- and the Miami Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to
http://www.tapr.org/tapr/dayton,
or send email to tapr@....

33. Equipment update

Topic: 30 Message: 33

Update equipmentwise on my end is the 24db grid antenna is done being rebuilt & ready for service,I got the Sony Digital Handycam configured Thursday night and am now testing it on NetMeeting,Yahoo and AOL IM.

I'm going to need a couple antenna adapter/pigtail cables for the AP and webcam end,is anyone making these cables locally or do we have to purchase them from FAB or Hyperlink?

I got crimpers to crimp the RP-TNC and N connectors on LMR240. I've
made up a few, but still mess up a connector occasionally.

FYI, I'm planning on going out Sunday and attempting to bridge my
Wap11 to the tower AP. I'm working it out now, but it's not going
well.

35. weekend 04 Wild Ride test activites

Yahoo group: DAWG-HSMM
Date: 2004-04-12 03:56:17 UTC
From: J. Beadles
Topic: 35 Message: 35

```
Did some experimenting with client bridging over the weekend. Also
did some diagnostic work on this D-Link DCS-1000W wireless camera.

The client bridge experiment consisted of:

1. 1x Linksys WAP11 v2.8
a. IP aqddress 192.168.1.15
b. Physically connected to the BEFW11S4
c. Client bridged to the WRT54G

2. 1x Linksys BEFW11S4
a. IP address 192.168.1.1
b. DHCP server turned on
c. Wireless service turned off
d. Internet connection connected to the WAN port

3. 1x Linksys WRT54G
a. IP address 192.168.1.2
b. DHCP server turned off
c. No internet connection
d. Used only as a wireless AP

4. 1x Linksys WAP11 v2.6
a. Broke while attempting client bridging
b. No longer responds to pings
c. Hardware reset produces no response

5. 1x D-Link DCS-1000W Camera
a. IP address 192.168.1.30
b. Attempted FTP xfer of pics
c. Video works, but FTP doesn't

Network configuration looks like this:

Laptop (orinoco card) <- - - - - -> WRT54G
|
WAP11(v2.8) <- - - - - - - - - - - - -
|
BEFW11S4 ---(wired connection)--- DCS100W Camera
|
(internet)

Result:

1. Laptop wired to the BEFW11S4
a. Can ping all nodes
b. Can access the camera
```

c. Can access the internet

2. Laptop connected to the WRT54G via 802.11b
a. Can ping the WRT54G and the BEFW11S4
b. Cannot ping the WAP11 or the DCS-1000W
c. Can access the internet
d. Cannot access the camera or the wap11 admin page

Anybody have a clue what is going on here?

Also, I made extensive attempts to get the camera to FTP frames to my web server but was unable to do so. I resorted to putting a packet sniffer on the connection and was able to observer the camera attempting to ftp pics, but seemingly failing to do so. Manually ftping a file to the server resorted in a very different packet trace. However, I don't have the knowledge to take this any farther. Anybody want to give it crack?

From: J. Beadles
Topic: 39 Message: 39

Forwarded...

Among the changes to Part 97 proposed today by the FCC is the inclusion of the 6 Meter, 2 Meter and 222 bands for Spread spectrum operations. The FCC is also proposing to permit Auxilary Operations above 144.500 MHz except in the Space Comms segment from 145.8 - 146.0.

The FCC Notice of Proposed Rule Making, on the web at, http://hraunfoss.fcc.gov/edocs_public/attachmatch/FCC-04-79A1.doc, in WT Docket 04-140, is available on the FCC Web site.

40. Wednesday night testing session results

Yahoo group: DAWG-HSMM
Date: 2004-04-16 21:59:17 UTC
From: J. Beadles
Topic: 40 Message: 40

On Wednesday April 14th, we performed a test session against the NT5NT access point. The NT5NT AP is a repackaged Linksys WAP11 v2.6 connected to a 16db panel antenna facing Wiley. The AP is on the roof of the 16 story Nortel building NNE of the intersection of Campbell Road and Central Expressway in Richardson. The testing party was run at the park at the east end of Lookout Road, east of Plano Road.

During the test, we had 4 clients connected through the tower AP.

1. Two were laptops (KD5OUG, N5OOM) at the park. One was equipped with a 24 db grid antenna, the other with an 8dB yagi.
2. One was a laptop (N5PYK) at Lake Lavon (15.75 miles) with a parabolic dish fed from a home made patch, gain estimated at 24 dB).
3. One was a client bridged WAP11 physically connected to a BEFW11S4 (radio turned off, DHCP on) and a Dlink DCS-100W internet camera. The bridge radio was connected to a 14dB yagi.

All stations were able to ping each other and run Microsoft Netmeeting. I suspect that the connection to Lavon was slow based on the distance, and there did seem to be some substantial delay and maybe packet loss. Still working out how to diagnose these problems.

41. 04 Wild Ride update

Yahoo group: DAWG-HSMM
Date: 2004-04-16 22:03:35 UTC
From: J. Beadles
Topic: 41 Message: 41

All,

KD5OUG has been notified that we will not have access to the roof of the Wiley H.S. Stadium. Therefore, we have one 25 mi hop we will have to make from the NT5NT AP to Community H.S. near Josephine. Joe, I think we'll have to arrange a testing session for this one. I'm thinking we probably ought to work it out so that one of us can adjust the NT5NT antenna for max signal while the other is on site.

42. RE: [ntms-hsmm] 04 Wild Ride update

I have a nice 3 ft diameter solid dish with feed that you could use if you think it will help. It should have a little more gain than the BBQ grill antennas.

46. Urgent - Tower Climber Needed for Access Point

Yahoo group: DAWG-HSMM
Date: 2004-04-20 05:19:21 UTC
From: Douglas Kilgore
Topic: 46 Message: 46

Someone with tower climbing equipment is needed to climb a 60ft tower to check an 802.11b amplifier mounted on the tower.

Larry Essary WA5WWH, owner of Pulse.Net has offered to connect us to the internet for the May 8 Wild Ride bike rally. However we need to get the model number off of the tower-mounted amplifier before we can order some needed parts to feed power up the coax.

If you know of someone with the tower climbing capability, please reply immediately by email. We need to get this done before this Friday, Apr 23.

Well, I took the plunge and ordered two MMCX(rp) to SMA-M pigtails from these folks. They will make up custom cables for the same price as their standard offerings (!) There price structure is this:

$14.95 per cable (custom or otherwise_
$6.00 shipping for the first cable
$0.50 shipping for each additional cable

They take PayPal and their email address is available on their web page. They have no order server at this time. I will let the group know when I get my cables and try them with my SMC Elite 200 milliWatt 802.11b card.

73,

RD - KC5QHH

Douglas Kilgore <douglas.kilgore@...> wrote:
Someone with tower climbing equipment is needed to climb a 60ft tower to check an 802.11b amplifier mounted on the tower.

Larry Essary WA5WWH, owner of Pulse.Net has offered to connect us to the internet for the May 8 Wild Ride bike rally. However we need to get the model number off of the tower-mounted amplifier before we can order some needed parts to feed power up the coax.

If you know of someone with the tower climbing capability, please reply immediately by email. We need to get this done before this Friday, Apr 23.

Joe Jurecka, N5PYK is going to be up on the Nortel tower Saturday for the 10GHz contest. So, now is a particularly good time to go out to Wild Ride rest top 3 in Josephine to verify connectivity and to make sure the NT5NT AP antenna is pointed as accurately as possible.

If anybody wants to run up with me just yell and I'll coordinate. Joe will be up there from 8am, so I'm figuring on getting out there around 10am or so. I'm expecting to line up the antennas using my 24db bbq antenna and my orinoco card and client bridging using the WAP11 we had set up at Lookout park.

Tony, you got your dish antenna handy? this might be a good time to try it out.

Topic: 55 Message: 55

I'm seeing a bunch of surplussed Proxim Harmony 5ghz access points going dirt cheap on ebay. I got two for a grand total of $15. These units appear to have a complicating factor which is that they require a hardware AP controller to work.

Still, because of the low price, I'm seeing some experimentation on turning these into bridge radios.

Boy, I'm just full of posts today...

Whilst looking through eBay, I ran across a bunch of Play, Inc. Snappy 3.0 units for about $8 after shipping. These units are really good video frame grabbers. You plug a camera (camcorder?) in one side, and plug the whole unit on a PC parallel port. The device grabs really good quality video frames in up to very large sizes.

This'd possibly be a good option if you have a camcorder for the Wild Ride but no webcam. I used it with a freeware software product that grabbed frames on a timed basis and ftp'd them to a server. Worked well, but can't remember the name.

The company appears to be out of business, but drivers are available at:
http://www.video-drivers.com/drivers/77/77998.htm

I will be going out there also. I have my stuff loaded into my Suburban so I will drive out. For testing I have the Ultimate speaker stand which will go up to about 10 feet. I'd prefer to use it at another location on May 8.

I will also bring a 30ft push-up antenna mast with guy wires and stakes. If we mount the access point on the mast, we would need cabling to bring up power up to it - or - I have a 25ft RG214 Coax with Male N-connectors on each end.

I have several pieces of 5/8 inch plywood from another project. One could be used to mount the wire dish on one side and the Linksys access points on the opposite side. This could be mounted up on the mast. If necessary we could use a 12VDC to 110VAC inverter and run an extension cord up to the equipment on the mast.

I just talked with the Asst. Superintendent of the Community ISD. The area on school district property we want to use will be busy this Saturday, Apr. 24 from 10:00am to 2:00pm. There is some type of luncheon. We can't have access to that area then. There'll be traffic to contend with.

I think we should still plan to go on Saturday AM but earlier and then plan to use the parking lot of the pizza shop just north accross the road from the school property. It's still on the ridge and may even be a better place than the school district property.

Received. I have to make a Tanners run when they open - I'd like to get to Tanners about 9:30 and make it out to Josephine after that. Bill, you interested in Tanners? If so, could you make it over to my place by 9:00?

I'm not sure what time this puts Bill and I out in the Josephine area. Doug, shall we coordinate by phone after we get done with Tanners?

67. 802.11b 25 mile link established

Yahoo group: DAWG-HSMM
Date: 2004-04-26 06:14:27 UTC
From: Douglas Kilgore
Topic: 67 Message: 67

Last Saturday, Apr. 24 a 25 mile 802.11b link was made between KD5OUG at Nevada community school and N5PYK at the Nortel building in Richardson. A MS NetMeeting connection was made for two way chat. The link was made with the Linksys WAP-11 on Nortel with 16 db antenna and 200mw SMC2532W-B card and 21 db barbeque grill dish at Nevada.

The link was established at 1Mbps but the connection was itermittent. There were trees on the path. After a better antenna site with direct line-of-sight to Nortel was found about 100 yards away from the first location, the Nortel WAP11 locked up so further testing couldn't be done.

N5OOM, K2CHP, KD5YVL AND KD5WIN were also at school location.

While not a complete success, the afternoon was very encouraging. A connection to the internet with sufficient speed to FTP still photos taken by web cams should be possible.

A testing night for all 802.11b equipment to be used on the Wild Ride will be held Tue. Apr. 27 at 6:45pm. The location is the parking lot of the Bush Turnpike Station of DART rail where it crosses under 190. The parking lot is just south of the new Fry's store in Plano.

That mast was galvanized conduit, 1-1/4". The 2" clamps on the BBQ
grill antennas won't clamp down on a 1" mast. Problem with it is
that you can't get more than 1 section out of it. I'm considering
some military mast sections like W5ADC used at the SET last week.

After the test in Nevada, K2CHP, KD5YVL, KD5WIN and I moved to
Lavonia Park, 15.75 mi from the AP. We were able to get in
immediately with the client card, so we set the bridge back up. We
were able to get the bridge to work after adjusting the antenna for
elevation (it had been pointing downward). We were able to get into
the management page, so I'm thinking that the NT5NT AP was fine. I'm
thinking you might have had some exotic technical issue keeping you
from getting in. I wish we'd had you bring your whole laptop over to
the playground area.

72. 10 GHZ Sprint

Rain only enhances microwave experience.

I woke up Saturday morning at 630AM to the sound of rain hitting the roof. A quick look of the radar indicated that there was no hurry to get up to Nortel as the rain would be continuing for several more hours. Alas, went back to sleep for another two hours. By 10AM, I had arrived at Nortel. Several stations were already chatting on 144.300. It certainly took a bit longer to get on the air than I expected being the only person there, but once things were operational, it was ON. First contact was with NM5M over about 10 miles west of Nortel. It was substantially a no brainer. The next QSO was substantially more exciting. While the rain was a downer early on, it made the 192 mile rainscatter QSO with K5LLL near Bastrop really easy. Signals were found in less than a minute. The showers that we used were not terribly intense (40dBz or so) but provided plenty of signal. The next contact was a tad tricker. Bill, W5GVE was down in EL19kw (yes the rare EL19 grid). Ended up aiming further east to make this contact as the most intense precipitation was over Robertson County (north of College Station.) After that, I continued for another hour making contacts with the locals WA5TKU, WA5VJB, and WW2R before a shower forced me to shut down operations at Nortel. Fortunately, Nortel had an 802.11 wireless lan that covered the roof so I was always able to have the radar display active.

A few of the 802.11 group came by and we did a little fine pointing of the 802.11 antenna in support for the Wild Ride on May 8th which further extended the best DX to 25 miles.

After a bit, it become evident that the showers would continue on and off throughout the day and I elected to move north to my residence. Worked WW2R and NM5M again, and finally worked K5SZJ from near the Allen outlet mall. After that, Eric took off toward Frisco and we made another contact via 800' tower scatter.

Around 7pm, after the contest had ended, additional contacts were made between WW2R, N5PYK, and K5LLL from EM13qd, EM13qe, and EM10kf respectively via some moderate thunderstorms in the Killeen area. The N5PYK setup was very simplistic. Put 10GHz setup in the doorway of the shack, aimed over the house across the street, through the trees, and still hit the rain strong enough for the QSO. Moral is, even if you don't have a great site, rainscatter makes everything much easier. VUCC is easily obtainable at nearly any location..you just have to coordinate with other stations when it rains.

Overall, a great bit of fun. You just never know how rewarding and neat the 10 GHZ band is until you get on the air!

Joe

73. Activity report for Tuesday, April 27

Yahoo group: DAWG-HSMM
Date: 2004-04-28 13:13:52 UTC
From: J. Beadles
Topic: 73 Message: 73

Members of the group met in the Dart rail parking area at 190 and Renner road for the purpose of continuing testing the bridge setup for the Wild Ride on May 8.

One difficulty is that the NT5NT AP, located on top of the 250 ft Nortel tower bldg, is that the AP is pointed at Wiley and the selected location is about 90 degrees off boresight of the antenna. At this distance this was not believed to be disabling, and KD5OUG was apparently able to establish connection using his SMC high power card from the location. Neither, N5OOM's laptop using an Orinoco card nor the bridge setup were able to connect to NT5NT. A search with Netstumbler showed no signal from the tower.

Wow, good pattern on that antenna! The bridge was relocated to Lookout Park. N5OOM's Orinoco card was able to establish a link with NT5NT with abt -65dbm signal. However, the bridge was still unable to connect, which is odd since the bridge was able to connect from 15 mi away on saturday. After some testing, KD5OUG was called to relocate to Lookout Park. Some time after KD5OUG shut down, the bridge successfully connected through for traffic outbound from the bridge. When KD5OUG turned his SMC card back on, the bridge link was lost again.

There seems to be circumstantial evidence that the SMC card interferes with the client bridge setup that we are using. Both the Orinoco and SMC cards were apparently able to connect with the NT5NT AP, were able to ping the unit and raise the management web page, but were unable to pass traffic to each other. The lack of a bridge admin page on the WAP11 AP makes it very difficult to determine what the bridge is seeing.

The unreliability of the bridge hardware would indicate that it is unwise to install the bridge at the Lake Lavon Army Corps of Engineers tower until further testing is done.

75. home wireless question.

Yahoo group: DAWG-HSMM
Date: 2004-04-30 01:41:35 UTC
From: Jerry Karlovich
Topic: 75 Message: 75

I just installed a 802.11b wireless in my home. I have the WEP configured for privacy. I renamed my SSID as "wireless". The card in my machine is a Linksys WMP11 PCI. I also added a 7.0 DBi external antenna because my machine sits on the floor. I run XP Home.

Somewhere else in my neighborhood is an open router SSID of "linksys". The signal to this router is "low". My signal from my router is "very good".

OK, here's my problem. My computer by itself will automatically switch over to the "linksys" connection after I choose my "wireless" connection. Every so often a little flag will appear down in the lower right corner where the wireless icon is located indicating that the connection is to "linksys" and the signal is low. I will click on the "available wireless connections" and reselect my wireless router. Only after a while I notice I'm back on the "linksys" connection.

I'm very new to this stuff so be gentle. How can I prevent my machine from by itself switching from my very good "wireless" connection back to the lower signal "linksys" connection?

I don't have XP myself, but I have been doing some reading. What I
found suggests that XP allows you to manage wireless connections two
ways. One way is through the utilities supplied with the card and
the other is to let an XP utility do it. If XP does it, it scans
around changing channels constantly. So, I suppose the key is to not
let XP do that.

Again, I don't have XP, so can't verify for certain.

Yesterday I, in an unrelated situation, edited my desktop html file found in my wallpapers folder. I added a <img scr> to WFAA's radar loop images. I also inserted a 180 second refresh meta tag in the <head> to keep the images up to date. The very act of the every 3 minute refresh "tickles" the connection and Mr. Chips (my pet name for my computer) hasn't over a 12 hour period changed connections. Although the other connection "linksys" is still there. I guess if I don't click on a link or something over a period of time, XP goes a wondering. I was beginning to think that maybe it's alphabetical? Sounds silly but "linksys" always appears on the top of the list before "wireless". I was going to change my SSID to "kd5om" since K is before L and see if that solved the problem. Maybe I will this weekend. Kd5om will appear before "linksys" in the line up of available connections. I will let you know what happens.

Jerry, try this:
Find the Wireless Network Connection icon in the notification area of the taskbar (a tooltip pop-up balloon should appear to help you, if active). Right-click the icon an then left click "View Available Wireless networks".

First, highlight the "Linksys" SSID on the "available wireless networks" list, and then make sure that the check-box labeled "Allow me to connect to the selected wireless network, even though it is not secure" is unchecked for the "linksys" SSID.

Click the "Advanced" button at the lower left of the Wireless Network Connection dialog. You should be at "Wireless Network Connection Properties". There you will see lists of available and preferred networks. Highlight "linksys" on the preferred list and click the "Remove" button below the list.

Now, click on the "Advanced" button at the lower right of the same wireless network connection properties dialog. Make sure "Automatically connect to non-preferred networks" is unchecked, and close the Advanced dialog.

Click OK to save your changes and close the "Wireless Network Connection Properties" dialog.

Now right-click the Wireless Network Connection notification icon and select "View Available Wireless Networks" again. You should not see "Linksys" on the "Available wireless networks" list. If you do, you may have to go back into properties, and make sure that your WAP's SSID is at the top of the preferred list, by highlighting it and then clicking "Move up". This has never happened to me, but I'm trying to be comprehensive here...

Hope this helps and I hope my step-by-step approach wasn't annoying.

From: Jerry Karlovich
Topic: 80 Message: 80

Tnx to John, John and Tom for your suggestions on my home wireless problem. I was able to maintain connection to my router all weekend. I renamed my SSID as kd5om.

Any suggestions on high gain antennas for my router? I plan on setting my router on the top shelf of my book case, run a wire through the ceiling to a high gain antenna in the attic. Maybe even above the roof. I figure at 2.4 GHz line loss is astronomical! Even with the expensive hard line. I have seen many 12 to 16 DBi antennas on various web sites for under $40.00 (directional). Does anybody have any better ideas?

Do we exchange QSL cards if you can hear my router? At 2.4 GHz what is considered DX?

Jerry KD5OM

Jerry,for all around the home/property use I'd go with a performance omni-directional personally but I'd mount it at the mid point level of your home that you'll be going wireless with that way you'll be in the optimum window of the vertical beamwidth for all the floors/levels with your access cards.
If you're using a Linksys wireless router for your home network,upgrading the lil stock 2db antennas to the 5.5 db aftermarket Onmis could be an easy option.I've read positive feedback on the replacement 5.5's and there's no coax to run.
I'm sure John N5OOM will chime in as well on this subject :-)

82. Good News for Wild Ride HSMM + Monday Testing

Yahoo group: DAWG-HSMM
Date: 2004-05-03 16:12:34 UTC
From: Douglas Kilgore
Topic: 82 Message: 82

Good news for the Wild Ride HSMM effort.

N5PYK and KD5OUG tested again from Lookout park Sunday. After a quick chat with Linksys tech support, Joe was able to get everything talking in a controlled manner. The backbone of our Wild Ride network is taking shape.

The Nortel WAP11 configuration was changed to be a Wireless Bridge with Point to MultiPoint on channel 3.

At Lookout another WAP11 was configured as Wireless Bridge Point to MultiPoint Channel 3 to talk back to Nortel. The Lookout WAP11 was connected by Cat-5 ethernet cable to a BEFW11S4 wireless router set to channel 11 with a different SSID. A WSB24 Power Booster amplifier will be connected to the BEFW11S4 to give a greater coverage range at the rest stops. Each BEFW11S4 will be set up with MAC filtering.

All brands of 802.11b cards in laptops were able to associate with the BEFW11S4.

This configuration can be used at Rest Stop #2 and 3.

What we were unable to test Sunday was a connection to the Internet. KD5YVL has configured another WAP11 as a Wireless Bridge Point to MultiPoint and will be connecting it to the City of Richardson feed from Eisemann Center on Monday. That unit will associate with the Nortel WAP11 thereby providing internet access to Start/Finish, Rest stop #2 and #3. The CoR feed can be turned on and off remotely by KD5YVL. It will be turned on only during test times and during Wild Ride operations.

MONDAY NIGHT TESTING.
We need to test everything again with the internet connection. So we'll meet again at Lookout Park, 6:45pm. Talk-in 443.325 PL110.9 and 147.12. Bring everything that you are going to use on Saturday for a shakedown. Location: From corner of Plano Rd and Lookout, go east to the park. Turn right in parking lot and go to south end.

We need to make sure that Rest Stop #2 equipment works so that it can be mounted on the Corps of Engineers Tower at Lavon Dam as soon as possible. Considering weather and his work schedule, we want to allow KD5MNO greatest flexibility for scheduling the tower climbing.

A separate message will be sent covering equipment still needed at Rest Stops.

See you there.

All,

Ok, so in the near future, we have:

June 12 - Collin Classic - this is one short 802.11b hop across McKinney HS so we can feed APRS internet data to the event logistics staff.

June 18, 19 - Hamcom - We have a large HSMM block of presentations planned. We need an external internet feed into the area, and it'd be really nifty if we could run a shot from the NT5NT AP to the Arlington convention center (abt 25 mi) so we could have a webcam shot or something as a demonstration target. Maybe demo IRLP links over HSMM or something. I'll have enough to do, it'd sure be nice if somebody else could drive this project.

September ?? - Plano Balloon Festival - Once again we want to have 802.11b coverage of the Plano Collin Community College area, complete with internet feed. But better, this year.

We now have 41 members, does anybody else have any projects they'd like to do? I'm interested in setting up a metropolitan area network to cover the D/FW region, and have heard others express this desire as well. Haven't heard anything definite about it though.

Wednesday's task - put up two bridge radios and a webcam on the Army Corps of Engineers tower at Lake Lavon. Arrived at 7, on the tower at 7:30, off at 3am. Progress - got the east bound bridge up, antenna connected, webcam installed, power and ground ethernet cables connected. Was able to talk to both nodes over network cable.

Tomorrow's task - return to the site, install the westbound bridge and make both paths work. Also tune the webcam.

Date: 2004-05-07 06:07:09 UTC
From: J. Beadles
Topic: 88 Message: 88

Arrived on site at 6:30, climbed Lake Lavon Army CoE tower at 7:30, off at 11.

Confirmed east bound connection to RS-3 with a RSSL of -68 dBm, also tuned up webcam mounted on the tower.

Installed west bound bridge radio, antenna facing the NT5NT bridge. Could not establish connection with NT5NT, cause unknown. Placed radio in access point mode for testing.

To do:

1. Use antenna to look for the Army CoE bridge from NT5NT.

2. Complete internet connection from the Eisemann Center to NT5NT

Topic: 89 Message: 89

The Richardson Regional Med Center's Wild Ride bike rally starts at 8:00am CST Saturday May 8. Hams from several clubs are providing communications. Something new has been added to coverage.

Web cams are being placed at each of the rest stops and will upload pictures over the internet to the Richardson Wireless Klub web site every 30 seconds during the Saturday morning ride. Pictures can be viewed online during the bike ride at:
http://www.k5rwk.org/wildride.html

Hams from the North Texas Microwave Society's High Speed MultiMedia group have arranged a series of 802.11b bridges and access points on 2.4 Ghz to cover the 25 mile distance to the farthest rest stop. Fortunately the rest stops line up in almost a straight line from the 18 story Nortel building where members of the Nortel Amateur Radio Club have an 802.11b access point. More information about microwave and HSMM is available at the NTMS web site: http://www.ntms.org and http://groups.yahoo.com/group/ntms-hsmm/

Members of Dallas Amateur Radio Club are bringing the DARC Emergency Communications Van and will act as net control. Repeaters from the Texins ARC and Plano ARC and Nortel ARC are being used for voice communications. Several members of the Garland ARC are providing APRS trackers and vehicles can be observed on a route map on Findu.com.

90. 04 Wild Ride - Brief Report

Yahoo group: DAWG-HSMM
Date: 2004-05-10 03:16:04 UTC
From: J. Beadles
Topic: 90 Message: 90

I'll be writing up a longer post mortem later, but for now the brief report is that a major part of the network could not be made to work and could not be diagnosed in the time allotted. Some of the problems appeared to exist on the wired part of the network, but we'll have to work it out. Other parts worked fine, indicating that the concept is sound. One immediate lesson is that we need better diagnostic tools.

91. Wild Ride Web pages

Yahoo group: DAWG-HSMM
Date: 2004-05-10 07:00:12 UTC
From: Douglas Kilgore
Topic: 91 Message: 91

The published web page at http://www.k5rwk.org/wr/wildride.html was to be the main page off of which links to various pictures taken by web cams on the 2004 Wild Ride bike rally would be visable. The pages did not work properly on Saturday morning but two do now after the fact.

WEB CAMS
K2CHP's web cam at Northstar and Renner and KD5OUG's web cam at Rest Stop #1 were connected to the web with wireless access points into private DSL lines. K2CHP ran a Sony DV camcorder into a USB video capture unit on his laptop which had a Senao wireless card. The Senao card then linked to a wireless access point in K2CHP's nearby apartment. KD5OUG had a Sony Hi-8 movie camera connected to an X-10 USB Video Capture Adapter installed on his laptop. His SMC high power wireless card linked to an wireless access point installed in an office near rest stop #1. Both hams used shareware Active Webcam by Pysoft to grab individual still frames and upload them to the Richardson Wireless Klub's web site using FTP (File Transfer Protocol).

The web pages were created with an assumption regarding the numbering system of the camera images. Proper testing was not done to insure that in fact the numbering system worked as expected. The numbering system was different so pictures did not appear on the web pages. The filename of the saved images was expected to be cn0001.jpg, cn0002.jpg, etc. Instead the programs created the filename cn0001.jpg03, cn0001.jpg05, etc.

The links http://www.k5rwk.org/wr/north.html and http://www.k5rwk.org/wr/stop1.html now have a photo available for viewing.

More work needs to be done to understand the capabilities of the Active Webcam software and the process of uploading photos to the internet.

Web cams at the Start/Finish, Rest Stop #2 and Rest Stop #3 were not able to upload to the internet due the lack of a connection through the planned Nortel link. The camera perpared by KD5YDL and installed on the Corps of Engineers tower at 125 ft by KD5MNO was zoomed in and looked at the west end of the Lavon dam where riders past.

APRS
One page of the Wild Ride images was to be a route map on Findu.com displaying the location of SAG and supply vehicles. The software functioned properly however in the heat of battle trying to get the web cams operational, the proper data containing callsigns and tactical callsigns was not uploaded to the findu page. Next year it will be better.

We learned a lot working toward the goal of linking the rest stops with web cams to the internet. Just wait until next year.....

92. K2CHP wireless link feedback/follow-up

Yahoo group: DAWG-HSMM
Date: 2004-05-10 15:45:04 UTC
From: BILL K2CHP
Topic: 91 Message: 92

Now that Doug and John have both posted their follow ups to the event I'll go ahead and post my additional feedback to the group as well.
My wireless internet link consisted of an Effecient Networks Speedstream 5100 Ethernet ADSL Modem running with 50' of CAT6 ethernet cable to a Linksys BEFW11S4 v.4 802.11b router located in my garage.The 11S4 then was then connected to a Maxrad 14db panel antenna with a 5' length of RG58 which was temporarily mounted just above the garage door outside with a clean view to the roadway about 1/3 mile away.

At the remote location I utilized a Toshiba Pentium 3 notebook with WinME(blech!) to which I went wireless using the Senao 200mw Wireless LAN PC Card connected to a Confier 24db directional Grid antenna fed by 25' of Andrew Heliax on top of a 10' length of mast aimed at the Access Point/Internet Gateway.
I was able to maintain a 497 kbps upload/5000 kbps download with a 45% link quality 40% signal strength for the during the 4 hours at Northstar.

With bandwidth door almost running at full capacity I was able to run multiple browsers including one from the K5RWK Wildride Webcams URL which I must say was done top notch,it was very helpful on my end as I could monitor what the Sony Digital 8 Handycam was uploading to the server via Active Webcam software and how I could make adjustments.

The webcam software I have to work with as some of the images appeared to be pixelized somewhat at the Wildride Webcam URL but the images came through regardless but I'd prefer them to be much much sharper for the next event if it takes equipment/software changes to do so.

Overall I was exceptionally pleased with my wireless equipment layout which could have not come together without the assitance of the NTMS/HSMM group!

Hi all,
Wanted to say thank you to all of you who contributed so much time and energy to the Wild Ride prep. While we didn't acheive all of our objectives (they were quite ambitious), we all learned some valuable information. I hope that everyone got a little something positive out of the experience. It was a team effort and without everyone's cooperation, we would not have had the successes that we did.

Joe - N5PYK

97. RP Connectors

Yahoo group: DAWG-HSMM
Date: 2004-05-12 13:19:51 UTC
From: Randall Dunning
Topic: 97 Message: 97

I just failed in my attempt to get some adapters from Hyperlink Technologies because the company will only talk to you if you are willing to spend $100.00 or more. Otherwise you are respectfully requested to send your paltry order elsewhere. FAB Corp and the others referenced in a previous post only advertise a subset of the RP adaptors available from the manufacturers. Now I have found a company that will sell hard to find connectors in onesies and twosies such as the N-Male to RP-TNC-Female. The company is called Altelicon (www.altelicon.com).

Using the RP-TNC-Female to N-Male connectors allows those who are making enclosures for their APs to attach the small antennas that come with the AP to the easy to find N-Female chassis mount jacks commonly used for getting RF out of the enclosure. (Yes I know you can use chassis mount RP-TNC-Female connectors as the enclosure pass through but the standard N-F connector has too many advantages to be ignored.) For some events, where one wishes to limit the radius of the AP coverage, using the small antennas makes sense. For example, providing access to a small Field Day site without providing access the surrounding neighborhood. It is also good for testing the AP in its enclosure without having to set up the big antennas. So, anyone who wants a piece of this action can drop me an email at kc5qhh@... as I will be placing the order sometime before noon. Connectors are $5.95 each and shipping is $6.50 for the entire order.

103. APs / Bridges from discrete components

Yahoo group: DAWG-HSMM
Date: 2004-05-20 14:08:12 UTC
From: J. Beadles
Topic: 103 Message: 103

After the Wild Ride problems, we've been discussing a bit back and forth where to go next. I'm thinking that if we were to look at a metropolitan backbone network, the way to go would be to do something like BARWN's Outdoor Router project. This uses standard wireless cards on OEM motherboards running Linux. Therefore you can use whatever routing or bridging protocols will run on Linux rather than being limited to what's in a consumer grade box.

www.barwn.org/docs/BARWN_outdoor_router.pdf

The BARWN project uses Soekris motherboards.

http://www.soekris.com/

Specifically, the net 4521, which runs on 12v, has 2 pcmcia slots and can boot off a compact flash. Price is about $194 in single units, cheaper in units greater than 1.

Also, I saw N5JXS post Microtik on another list. Microtik appears to have a whole line of single board "routers" and their own line of wireless equipment. They are more expensive, though.

That'll have to be tested, yeah. Still, this would be acceptable for
ackbone work with local distribution handled by the consumer gear.
At least that's where my line of thought is going.

NTMS, Roadrunners,

Invite your friends who are interested in microwaves and 802.11x activities!

The meeting agenda is as follows:

LUNCH

1200-1300 Lunch at Oxbow Steakhouse and Bar-B-Que.

ANNOUNCEMENTS

1255-1300 Announcements by NTMS and RMG

PROGRAM: NTMS

1300-1345 REFLOCK Success at 96 MHz, WA5TKU, Wes Atchison
Questions

PROGRAM: RMG

1345-1400 SMA Connectors + Show and Tell, N5GO, Jean Paul

1400-1450 HSMM Activities in the Austin Area + Demo
K5EJL, Joe Fisher, and KD5MFW, Glenn Currie
Questions

CLEAR MEETING AREA

1450-1500 The Oxbow closes at 1500, so all attendees must exit by 1500 hours (with all gear, etc.)

73,

Lloyd Crawford, N5GDB, EM10bf
Secretary-Treasurer

DAWGs:

Doug and I will be going up on the Arlington Convention Center roof Saturday morning with Barry GoldBlatt to sniff out the area for hotspots we might use for an internet connection for our Ham-Com forums. We could really use an experienced NetStumbler or two to make sure we don't miss anything. Contact me if interested. We tentatively plan to leave Richardson about 9 or 10 AM.

Also, if anyone knows of any hams in the Arlington area that we might use to get an internet link (they need to have a place to put an antenna that can 'see' the convention center roof, and a broadband hookup) please let me know.

73,

Bob K5WO

From: Jerry Karlovich
Topic: 117 Message: 117

Got today's question.

I just had a Linksys PCI 802.11b card die. I have been using a 7.0 DBi gain antenna (http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=45001&item=3093691813) with this card. Could high VSWR have a negative effect on the output device? Just how do you measure VSWR at 2.4 GHz anyway? I'm use to wavelengths 200 times that. I see on the web many experiments using DIY antennas. Is it just "do the math and hope all works well"? I can't amagine the cost of a Bird that reads 2.4 GHz.

Topic: 117 Message: 118

Jerry,

I wouldn't have expected the 802.11 card to be that fussy about the antenna; after all, people connect Pringles cans to them and claim good results. Could you maybe have a short in your feedline or connector?

At microwave frequencies, it's much more common to measure return loss, which can be converted to VSWR if you really want a mismatch expressed that way. Measuring return loss requires a steady signal source, a directional coupler, and an accurate way of measuring dB differences in power. I don't know of any way of making a WLAN card go 'key down' so it's not a good signal source for measuring. I have a 2.4 GHz source that sort of works and could measure the return loss of your antenna if your interested.

Jerry,

The Trusty Old Model 43 with a 430-182 Element will
do the job.
430-182 = 2400-2500 Mhz at 100mw.
430-240 = 2400-2500 Mhz at 250mw.

The problem is keeping the Card Output running.
Some cards have a test mode where they will generate a
Test Signal or CW Signal for Testing.

I had another machine in the house and did some swapping last night. The problem followed the card. Different card and same antenna works fine. Moved the dead card to another machine and it still didn't work. And it's beyond the 30 day return to take it back to Fry's but it is about 60 days old.

Is this a common thing or did I buy a lemon?

The short answer is theoretically yes.

The longer answer is that the manufacturers tend to do some proprietary stuff for bridging, so different brands don't necessarily play nice together.

Deal is, I have an office and of coarse a home qth. I just want to avoid paying for 2 Internet accesses for the different locations. The 2 locations are a little more than a mile apart and with high enough antennas, mounting the gear in ABS boxes near the antennas, maybe I can do this with just one Internet Access.

Any suggestions?

Oh yeah, you can do that, so long as you are doing both ends and are responsible for the eqpt. Just be aware that your ISP agreement may forbid you from running access off the premises. Not necessarily a prob unless they find out.

127. VHF and up contest this weekend

Yahoo group: DAWG-HSMM
Date: 2004-06-09 15:54:51 UTC
From: Joe - N5PYK
Topic: 127 Message: 127

Hi all,

I'd like to remind everyone about the VHF QSO party this weekend and encourage all to turn their radios on and operate at least a couple of hours during the contest. Every little bit helps and conditions could be decent tropo especially on N-S paths all the way up into Iowa. See http://www.iprimus.ca/~hepburnw/tropo.html Additionally, the June contest is also traditionally our best 6m opportunity. For those of your who are considering limited operation, the best tropo DX typically occurs in the evening and early mornings. Amazingly, conditions are often excellent Sunday morning (6-10AM) with very little participation. Consider getting on the air early and working some DX. Other great times to join in include Saturday evening and Sunday evening. The afternoons are where 6m openings often start popping, so its advisable to check into that as well. If you watch TV over the air, look for interference on the low VHF channels (2-6). If you see some, get to the hamshack. Don't forget to submit a log as well. NTMS won a gavel recently for top scores.let's strive to do even better.

We also have a chance for rain especially on Sunday.that means rainscatter. This is helpful for contacts on 2.3G and up. Don't forget to ask about the higher bands!

My plans call for activity on 50, 144, 222, 432, 902, 1296, and 10368. See you on the bands..

73,

Joe-N5PYK

Ken,

We found that we could access the WayPort wireless AP from the Windham hotel next to the convention center. It's a pay service, but pretty cheap compared to the alternatives. Were probably going to use computers configured for 'internet sharing' to bring the service into the building, since the Wayport AP is a Cisco box and we have Linksys boxes, so I don't the WAP11 in AP Client mode is going to fly. But we're open to suggestions.

73,

Bob...

The Wyndham AP sounds like a good deal. How much will it cost? I would be willing to chip in a few dollars to support the cause. FYI...I will arrive at the convention center midday-ish Friday and will stay at the Wyndham Friday night.

Will there be any sharing of the access with the convention attendees? Personally, I would love to see folks wirelessly checking their e-mail or surfing the web at the convention. After all, we are amateur -radio-operators.

My assistance is available if desired. My son Joshua, KC5TEG, and myself are more than familiar with internet sharing between wireless and fixed devices as I am sure others in the group are.

de Ken,
N5EQT

Ken,

I look forward to meeting you and your son. You can go to WayPort's web site to see their fee schedule. It's $10.00 per day per computer, but they have monthly and multiple connection rates as well. We're betting that if we put a router behind the PCs we use to connect, they won't see that we have more than one PC, but that could turn out to be a bit optimistic.

We were quite surprised to learn that the parking lot area around the Wyndham is hot, as well as from the roof of the convention center. I don't think it's an accident.

We plan to provide wireless connectivity to the forums and some of the booths; whether there will be general wireless access to the internet is beyond what we plan, but who knows?

73,

Bob K5WO

132. RWK Meeting Monday Change of Location

Yahoo group: DAWG-HSMM
Date: 2004-06-14 01:30:43 UTC
From: Douglas Kilgore
Topic: 132 Message: 132

The Richardson Wireless Klub will meet Monday June 14 in the Chapel of St. Barnabas Presbyterian Church, 1220 West Beltline, Richardson at 7:00pm. Note that this is a change from the regular meeting room. Please COME IN THE EAST DOOR.

Our speaker is Phil Salas AD5X, the author a many articles in QST magazine. His topic is "Efficiency of Short Antennas". This topic should be of great interest to mobile operators.

Visitors are welcome.

Doug Kilgore KD5OUG

We'll have to be careful about using internet sharing. Non-server
class windows software will only allow 5 clients at a time.

John,

I can install 2000 server if necessary. How many connections do you think
will be needed for the APRS and HSMM forums?
Also, if we put a router behind the win2000 box, will it really know how
many PCs are back there?

Bob

For the presenters, not that many. 2 or 3, If I remember correctly.
I think you are right, a router running NAT should hide the IPs
behind it, but not sure without testing.

One of the things we had discussed doing in the past was putting up a
web server in the convention center so that attendees could download
the presentations directly. Are we still planning on doing that?

Does anyone have a link or the information on how to make a Windows 95
box do "internet sharing"?

138. Linksys Compatability Problems

Yahoo group: DAWG-HSMM
Date: 2004-06-14 15:16:49 UTC
From: Douglas Kilgore
Topic: 138 Message: 138

For HamCom this weekend June 18 and 19, we are planning to put open access points in each of the three large meeting areas - the Exhibit Hall, the Meeting Rooms Hall, and the Great Hall. For an internet feed, we want to pay the daily rate for a connection to a Wayport hotspot running Cisco equipment in the hotel just 200 feet from the Arlington Convention Center. But we are running into problems connecting the external feed to the internal network.

We are open to suggestions!!

Here's what was planned:

A Linksys WAP11 Ver.2.8 access point on roof with dish antenna toward hotel. Cat-5 feed from roof down to a Linksys BEFSR41 4 port switch. The switch has NAT so we think the multiple MAC addresses will be hidden from the hotspot. From the switch, Cat-5 runs to 3 each Linksys BEFW11S4 wireless accesspoint/routers with WSB24 amplifiers attached. We have all this equipment.

We have been on the roof with laptops using Senao and SMC 200 mW client cards hooked to the barbeque dish antennas. Results 100% at 11Mbps - very strong signal.

Our problem is the WAP11. We can connect it to a laptop with a Cat-5 crossover cable and connect to the default admin page at address ...251. We tried to set it for remote client but it says it will work only with certain other Linksys products. We tried DHCP and also fixed IP. Left and right antenna. It won't associate.

To test we attempted to associate with a local restaurant hotspot. We can associate with a client card but not the WAP11.

One alternative we are considering is using a laptop with a client card to associate with the hotspot and using Windows XP as server. But that means either a long coax run or placing the laptop on the roof. Not good.

So can anyone suggest a piece of equipment that we can borrow for this weekend that will set on the roof and connect us to the hotspot?

To connect multiple people to the Wayport network you will require 2 AP's.

The first one needs to be running as a bridge (Wireless to Wired). Typically this AP would then be connected to a router. This setup works best with a broadband router such as a Linksys or Dlink. The Bridge AP is connected to the WAN port on the Router. One of the switch ports of the router is then connected to the a second AP. The second AP is the one everybody ois connected to.

By doing this Wayport only sees the Router as being connected and everybody else behind it can have access via the second AP. (See attached)

Lee, If I understand your list correctly, you are assuming that we have a cat 5 connection to WayPort? This is not the case; we will have a wireless connection (antenna on HamCom roof to WayPort AP), and that's the problem. We don't know of a box, other than a PC, that will let us connect to WayPort's Cisco AP. But still, that's an interesting idea-if we could acquire a cat 5 connection to WayPort inside the hotel, and they would let us run that cable out into the parking lot... 73, Bob K5WO > > Finally found the problem with my mail -- > > 1. 142. [Fwd: [ARRL-80211B] Linksys Compatability Problems]

Yahoo group: DAWG-HSMM
Date: 2004-06-14 22:11:15 UTC
From: Douglas Kilgore
Topic: 142 Message: 142

Does anyone in Dallas have a Linksys WET11 we can borrow for 4 days to use at HamCom?

Doug KD5OUG

RD,

One of the interesting things I came across while researching this subject on the web is that Win98 can be used for internet sharing but has no connection limit, unlike win 2K Professional.

John,

Hadn't even thought of it until just now... If someone could come up with a box, I guess we could run a web server on it. The boxes I plan to use as Win 2K 'internet connection sharers' are probably under powered to run a web server also.

Mmm, shouldn't be. Web servers don't really suck down that much CPU,
and we won't be getting that many hits.

From: Bob and Debbie Kmak
Topic: 113 Message: 147

Lee, A good suggestion at that. I'm not knocking it down, but I don't think any of the windows open. And they are coated with metallic-reflective stuff so an antenna taped to the inside of the window might not work so good... A few weeks ago, the desk clerk told us that both wired and wireless connections are available in the hotel. Actually, from the way I had to point a dish mounted on the (low) convention center roof, I'd just about swear that the source of what we are receiving is on or near the roof of the hotel, which doesn't make a lot of sense if the goal is to provide access to people INSIDE the hotel. But maybe they want to make it available to patrons in the parking lot too. So many questions... Bob ----- Original Message ----- From: "signup" To: Sent: Monday, June 14, 2004 9:46 PM Subject: Re: [ntms-hsmm] Ham-Com Net Snooping Hi, Yes, I am assuming that there will be a cat 5 connection in a room and most rooms have a window, so a WAP at the window would provide a signal to roof and a bridge on the roof could feed a wap to the convention center .. maybe more hardware than everyone was thinking of ... 148. Re: [ntms-hsmm] Ham-Com Net Snooping

Yahoo group: DAWG-HSMM
Date: 2004-06-15 03:06:17 UTC
From: Douglas Kilgore
Topic: 113 Message: 148

That was the first consideration. The rooms that have been rented by HamCom staff are located in a wing away from the Convention Center. Also the solid windows are covered with metalized mylar to cut down solar heating which also prevents RF from going thru. Doug Kilgore KD5OUG signup wrote: > > Hi, > > Yes, I am assuming that there will be a cat 5 connection in a room and most rooms have a window, so a WAP at the window would provide a signal to roof and a bridge on the roof could feed a wap to the convention center .. maybe more hardware than everyone was thinking of ... > > Just a suggestion ... > > /lee k5un > > ---------- Original Message ---------- > From: bdkmak@... > Reply-To: ntms-hsmm@yahoogroups.com > Date: Mon, 14 Jun 2004 20:47:10 +0000 > > >Lee, > > > >If I understand your list correctly, you are assuming that we have a cat 5 connection to WayPort? This is not the case; we will have a wireless connection (antenna on HamCom roof to WayPort AP), and that's the problem. We don't know of a box, other than a PC, that will let us connect to WayPort's Cisco AP. > > > >But still, that's an interesting idea-if we could acquire a cat 5 connection to WayPort inside the hotel, and they would let us run that cable out into the parking lot... > > > >73, > > > >Bob K5WO > > > > > >> > >> Finally found the problem with my mail -- > >> > >> 1. Do I remember that you installed an SMC card in the WET11? What type of connectors does it use? Can we borrow it for HamCom?

Okedoke. We still need to figure out what specifically is needed to connect to the Wayport, though.

On 14 Jun 2004 at 11:01, Brett Neilson wrote:

One thing about using with skywarn is that Dallas county does not direct spotters to positions. I know that Collin County usually does this. Could put net control in some sort of liability.

I think the Dallas area has not matured enough with APRS at events. Other parts of the country seem to have a better "plan" when it comes to events and APRS.

I like the presentation but we still need to work on using APRS in ECOMM situations. One issue that has been discussed at the RACES council is how to identify spotters. (separate from the rest of the icons) The other is use in the EOCs. I'm pushing that item.

See you at HamCom.

155. ECOM WET11 Upgradt to the Senao / Engenius 2511CD Plus EXT 2

Yahoo group: DAWG-HSMM
Date: 2004-06-23 15:21:45 UTC
From: Randall Dunning
Topic: 155 Message: 155

Hello Walt,

I am not likely to get around to doing the photo shoot until after Field Day so stay
tuned. In the mean time here is some additional info I used for my upgrade:

I used the Engenius / Senao 2511CD Plus EXT 2 and the O'Reilly WET-11 Hack Instructions
See:
http://www.oreillynet.com/pub/a/wireless/excerpt/wireless_hacks/?page=last

Here are some photos of the WET-11 inside from a French site:
http://www.wireless-fr.org/communaute/?WET11%20%E0%20nu

The one innovation I added was to replace the Linksys supplied card standoffs (they
are too long with the Senao card) with standard Radio Shack PCB standoffs (black
plastic model). These are the perfect length and support the card with gentle pressure
when the case is closed. Note that you cannot use the supplied screw to attach the
card, this must be returned to the junk box. Thus this becomes a passive pillar to
provide a measure of support.

The typical solution is to remove the standoffs supplied by Linksys entirely and leave
the card hanging on the PCMCIA connection pins. IMHO this is fine for a home unit but
not good for an ECOM unit that is subject to more potential abuse in the field. I will
eventually explore using double sided tape or rubber foam inserts to provide additional
support for the Senao card.

73,

RD

Randall,

Good to meet you at HamCom.

I am inquiring about the internal pictures of your WET11 that you put the 200mw card in. What card did you use?

Hope you can make the Austin SummerFest in August.

73,

Walt/K5YFW.

PS, Hope you are on the ARRL HSMM List at:
http://listserv.tamu.edu/archives/arrl-80211b.html

You can subscribe to our ARRL IEEE 802.11b Mail List at Texas A & M University. To subscribe, go to URL:

From: Joe - N5PYK
Topic: 156 Message: 156

Hello,

I'd like to say a special thank you and recognize several of our members who presented at Hamcom 2004. This is also echoed by the organizing committee of Hamcom. After all, those that volunteer make this organization successful!

NM5M - Eric

WA5VJB - Kent

WA5JAT - Jim

WA5YWC - Bob

N5OOM - John

N5JXS - Gerry

N5OLF - Jeff

KC7IIB - Brett

WW2R - Dave

Additionally, a couple other folks were involved with 802.11 internet on-site

K5WO - Bob

KD5OUG - Doug

The MTT and Hamcom Presentation

W5LUA - Al

WA5YWC - Bob

And those who helped man the NTMS table

WA5JAT - Jim

WA5TKU - Wes

AF8Z - Chuck

W5ETG - Terry

For all that are willing, if you would like your electronically formatted presentations to be put up on the web site, please let me know.

Joe-N5PYK

From: Randall Dunning
Topic: 155 Message: 160

Hello Walt,

Walt wrote:

>> Is that what I want (URL to ebay auction deleted)

Yes!

That is the Senao/Engenious card. The EXT 2 is the important part of the label. (Senao also has one that has a fixed antenna and no antenna ports which will not work in your application.)

The one pictured in the auction has the 2 antenna ports and no internal antenna. Remember, when you hold the card with the antenna ports to your right and the purple lable facing you, the main antenna port is on the top. This card uses an RP-MMCX jack which mates with the Linksys WET-11 v1.x antenna feed cable going from the card to the RP-SMA connector.
The SMC 200mw card uses an MMCX which will not work with the WET-11 v1.x which is a pity.
The SMC2532W-B card (appears to be the same as the Demarc Technologies 200mw PCMCIA) is a great little card with a very senastive receiver.

See:
http://www.smc.com/index.cfm?action=products_show_product&productcode=SMC2532W-B

You should probably go to http://www.demarctech.com/techsupport/downloads.html and make sure you have the latest firmware on the card since the cards on "everyone bids aganist you" can be of uncertain vintage. Also, the Seano wlan application does not have an "uninstall" that I can find, so that can be a problem if you have other wlan applications installed for Prism Chipset radio cards. The latest firmware for the Prism cards is 1.7.4.
(see: http://www.demarctech.com/downloads/reliawave-zm/DemarcFW1.7.4.zip)

Randall,
Have you checked the "add/remove" section in the Control panel in Windows? Look to see if IEEE 802.11b WLAN Network Adapter for Windows is in the program list as that may be the one for the Senao Engenius. I have not uninstalled it yet but the mentioned program above is what I'd select to remove from the PC.

I agree on obtaining the latest firmware for the Senao Engenius cards as the original is basically a dead stick.

Here's my photo album with some shots of the card and related gear.

165. Plano Balloon Festival

Yahoo group: DAWG-HSMM
Date: 2004-06-30 20:17:57 UTC
From: J. Beadles
Topic: 165 Message: 165

The Plano Balloon Festival will run on September 17, 18 and 19. The event will run for all three days, with two launches per day, one in the morning and one in the evening. I would like to have 802.11b coverage at

1. The launch field
2. The recovery staging site, either:
a. The Garden Ridge Mall parking lot
b. Or out at Popeyes Chicken at Jupiter and 15th
3. The Southfork hotel (northbound Central Expressway N of 15th), formerly the Harvey Hotel
4. The refuelling area (location?)

Tony Campbell W5ADC has obtained a couple of military surplus 35 ft mast units that should work really well for remote bridge radios. The masts are part of the AS-2236 VHF log periodic antenna system. These are available from Fair Radio Sales (http://www.fairradio.com/). They can go 20 or 25 ft without being guyed, or 35 ft with guys. Additional mast sections and guy rings are available on ebay, I wonder if they can go higher with more guys... Looked really good at the PARK field day!

These masts are pretty nifty because they come with a wide footed clamping tripod. You can insert mast sections from the bottom of the tripod and push it up. Nifty! Good find, Tony! These things go for $125 when purchased with a used antenna. It looks like we'll have 4 of them available for us, so we might actually be able to cover the whole area.

This is an event where it would be nifty to deploy webcams. If we could get webcams out to cover the vendor area and the missing child booths, I think we'd have something.

Last year I covered most of the launch field, if poorly, with a single BEFW11S4. A higher powered Senao access point in the right location should probably cover the whole area easily.

166. Re: [ntms-hsmm] Plano Balloon Festival

From: Bill K2CHP
Topic: 165 Message: 166

802.11b at the Plano Balloon Festival count me in
John. I can do webcamming either in the field or at
the launch area if needed.

This will allow me plenty of time to get my
configuration all tuned up for the three days.

168. WTS: 24dbi Die Cast Directional Antenna for 2.4G WiFi

Yahoo group: DAWG-HSMM
Date: 2004-07-09 07:19:17 UTC
From: w5evh
Topic: 168 Message: 168

Wanting to Sell:

1 24 dbi Die Cast Directional Antenna for 2.4G WiFi. This is a GREAT antenna. I have installed these for other projects.

I bought this antenna for a project, the project never happen and now I am stuck with this antenna. I have put it together and I know it works. I originally bought it from Fab-Corp for about $70 plus shipping (about $15). This antenna has never been put into production, nor ever spent a night outside. I would consider this antenna Brand New with out the box. MINT!

I am asking $60 out the door. Local pickup only. Reason I am selling is because I am moving and I need to get rid of things I do not need and I really need money for moving.

If you are intrested, please send me email to (bob at w5evh dot com).

Must sell fast.

169. Maxrad 8db Omni antennas

Yahoo group: DAWG-HSMM
Date: 2004-07-12 14:19:20 UTC
From: J. Beadles
Topic: 169 Message: 169

All,

A buddy of N0XLR wants to get rid of 20 Maxrad 8db Omni antennas. These antennas stand 17" tall, are 2.4GHz to 2.5GHZ and will work on 802.11b / 802.11g. He wants $20 each and wants to get rid of them in bulk, so I'll coordinate the group buy. Anybody interested please contact me.

176. Re: [ntms-hsmm] Re: Plano Balloon Festival

Yahoo group: DAWG-HSMM
Date: 2004-07-18 15:58:02 UTC
From: Brett Neilson
Topic: 165 Message: 176

Hello all,

I had some free time yesterday and did some HSMM testing on the launch field.

I placed an AP in the community college parking lot that overlooks the field. The AP was running an external Omni and was on a mast about 7 ft off the ground and battery powered. I could easily connect to the AP from all location on the launch field, as well as the vendor area and the area where net control was last year.

I am thinking that we could do the same uplink (same location) we did last year, and then link to the top of the hill. People would be able to connect to the hill AP using nothing more than a wireless card (no external antenna needed).

The only issue will be getting the single parking space on the hill to allow for the AP, as well as securing it enough that nobody has to be posted there.

179. Plano Balloon Fest

Yahoo group: DAWG-HSMM
Date: 2004-07-23 01:31:45 UTC
From: radiorandr
Topic: 179 Message: 179

As you have probably gathered by reading some of the recent messages, the Plano Balloon Fest will be held September 17 - 19. I have agreed to be responsible for the coordination of the HSMM support for this event. I am looking to you and your friends to assist me with the planning and execution of this event. Last year we had some limited support but proved to ourselves and the event organizers it's worth.

The purpose of our support is to enhance the safety of the event for ourselves, the balloonist and the public. To provide this support we will have the following goals in the order listed below:

1. Provide near real-time graphical weather information.
2. Provide support for APRS application sharing.
3. Provide support for Webcams in key areas.
4. Practice deployment of HSMM networks in support of public service events.

We would like to provide coverage at the following locations. Again in general order of importance:

1. Launch Field
2. Recovery staging area. Either Garden Ridge Mall Parking Lot or Jupiter and 15th.
3. Southfork Hotel
4. Refuelling area

While there is reasonable time left, there is a lot to do. Below is a general schedule for preparations for the event. The dates will be finalized as soon as possible.

Aug 1 General Meeting (Location TBD)
Aug 2 - 8 Site Surveys
Aug 9 - 21 Network Design
Aug 22 - 28 Equipment Commitments
Aug 29 - 11 Subsystem Test (Location TBD)
Sept 12 System Test at Field
Sept 17 Setup at Field and Final Equipment Test (Morning)
Sept 17 - 19 Event Support
Sept 19 Equipment Removal (Evening)

We will need to have a few "all-hands" meeting during the planning stages, but I will try and keep these as few as possible. I would be interested hearing you if you are interested. While I would like to have initial meeting on August 1 (a Sunday), if this date is not good for most of you, just let me know and we can reschedule it.

Thanks,

Tony

180. FEEDPOINT and Microwave Update

Yahoo group: DAWG-HSMM
Date: 2004-07-23 14:06:07 UTC
From: Joe - N5PYK
Topic: 180 Message: 180

Hi,
If you'd like to diseminate your enjoyment of 802.11 to a vast distribution in many countries, please consider contributing to the bi-monthly NTMS newsletter: FEEDPOINT. Kent Britain (feedpoint@...) is our long-serving editor. Let us know any projects that you are working on, descriptions of activities that you've done, theorizing about what might be possible with HSMM, or even how you put your portable tripod together. Anything that relates to microwave is acceptable!

The August edition goes out in about a week, so if you have something to contribute today, or write up in short order, I invite you to send it to Kent.

Please help spread the successes of 802.11 to the microwave community. It is your contribution that sparks interest in others!

Additionally, we are still looking for 802.11 speakers for microwave update. Take this opportunity to share the excitement of 802.11 with a good chunk of the big names in amateur microwave from all over the world.

If interested, contact me!

Joe

MeshAP is a great application! Very little control, but a great application.

If we have some developers in the group it would be great to take it and modify it for HSMM use. If you aren't familiar with the app, it will basically turn any PC with a wireless card into an AP. Upon boot it will search for things like Internet access and other nodes and from that it makes its routing table.

Clients of one node, will automatically have their traffic routed thought the network (hop, hop, hop) much like packet radio networks.

186. GARC July Club Presentation

Yahoo group: DAWG-HSMM
Date: 2004-07-28 23:13:21 UTC
From: J. Beadles
Topic: 186 Message: 186

This last Monday, Joe Jurecka N5PYK and I gave an HSMM presentation to the Garland ARC. Darn thing lasted an hour and a half. Randy Dunning KC5QHH, Joe and I brought demo materials, and Joe updated a brand new WRT54G to the SVEASOFT (right?) firmware on the spot. Randy and Joe were able to get Netmeeting to work with Joe connected to his laptop connected to the WRT54G, which was bridged to Randys AP through his Senao upgraded WET11.

I like this upgraded WRT54G. I think we need to experiment with this for balloon festival. In advance, of course. Well in advance. Right, Tony?

It does sound interesting. I do absolutely agree that this should be done well in advance of the event.

Yep it was the SVEASOFT firmware....you can even read client RSSI with it!
Really slick.
I have a local copy of the firmware just in case ;)
Performance wise, it blows my Netgear AP A/B away on range.

Fry's had a few boxes marked down to $56 plus a $10 rebate. So, not a bad
price for a very full featured router/ap
Joe

At 11:30am today, I must have picked up the last one at Fry's in Plano
and I did a little bit of digging around on that top shelf. Indeed, these
were "returns". Mine was labeled "S/N Mismatch".

On the other hand... there's a Back-To-School special Fry's is running:

An AirLink+ 802.11g/b Wireless Router with 4-port switch
Regular prices is $79.99 -- On sale for $29.99
NO REBATE-NO COUPONS! (i.e. this is the price you pay at the pump :)

Dunno how good it is but for US$30, I added to my toy chest this morning.
Oh, and they have PLENTY of them. Probably a closeout but... if it works,
it works. Hmmmm... maybe I should have waited for the No-Tax weekend? :)

Just went over there - they are marked $79, but on the center island
there's a tag that says that they are $59 until 8/3. Sure enough,
mine came up that way at the cash register.

191. Plano Balloon Fest

193. Sveasoft firmware upgrade for WRT-54G

Yahoo group: DAWG-HSMM
Date: 2004-08-02 19:23:09 UTC
From: J. Beadles
Topic: 193 Message: 193

I picked up a WRT-54G and put the sveasoft firmware on it. Seems to work, and we used it out at the Balloon Festival park last night. It's interesting in that it doesn't replace the Linksys web pages but augments them instead. This confused me at first, but when I looked, the admin page had a LOT more options.

One thing I didn't see was the signal strength indicator. Joe, what version did you load?

194. Re: [ntms-hsmm] Sveasoft firmware upgrade for WRT-54G

Yahoo group: DAWG-HSMM
Date: 2004-08-03 11:34:32 UTC
From: Bob and Debbie Kmak
Topic: 193 Message: 194

John,

I don't know if there is a way to see the received signal strength from the web interface (would be nice), but you can get that information from the command line after telneting into the box. This procedure is somewhat documented at: http://docs.sveasoft.com/SV-Wireless-AP.html

Use 'root' as a user ID and whatever password you have configured for the telnet login. Notice the screen dump for the wl assoc command, which includes RSSI and noise level. I can verify that this procedure works for Sveasoft Sartori-4.0 release, which is what I installed on the WRT54G that you lent me. I think there is also a command specifically to get the signal strength, but haven't tried it. See the Sveasoft doc at: http://docs.sveasoft.com/SV-RouterShellDocs.html

I'll look for that. I think I used the other release (whatever that
was), but somewhere I saw info that said the RSSI was now available
under the "admin", "wireless" web page. I sure didn't see it.
However, a command line reading will be more than sufficient.

Topic: 198 Message: 198

I loaded the Sveasoft Sokris 4.0G load on my WRT-54G and it worked like a champ. I too am wondering how to get at the signal strength indicator. I burned a CD with the 4.0G (WRT-54G), 4.0GS (WRT-54GS - "Speed Booster") loads, and the source. We need to have a "Fifty-Four-Mesh" party some time soon to learn how to set up and deploy mesh nodes quickly and efficiently.

In other news, I took my Senao equipped WET-11 and successfully bridged my BEF11S4 to the NT5NT WAP-11 on top of the Nortel Tower and was heartened to see the WET-11 signal strength page give me a signal strength number (68% in this case).

199. ID on HSMM

Yahoo group: DAWG-HSMM
Date: 2004-08-03 23:27:29 UTC
From: kd5inm
Topic: 199 Message: 199

Hi all,

This may have been asked before, but is everyone running this equipment, running it as Hams?, or are they running it under a Part 15? If running as a Ham, what is the proper way to ID, is there an expected mode to ID, such as CW or do you just type (callsign) in every 5 min. If FCC is monitoring your signal, how would they go about finding your ID in all the ones and zeros?

>(callsign) in every 5 min. If FCC is monitoring your signal, how
>would they go about finding your ID in all the ones and zeros?

Quick answers:

Remember slow, 1200-bps packet? How did you ID there? Hmmm... it was done by the TNC (hardware or software) putting your callsign into each and every packet it sent out. That was part of the AX-25 protocol. Keep in mind that in Amateur Radio you ID in the mode that you're transmitting although CW is the lowest common mode.

As for 802.11, think SSID. Put your callsign in the SSID and it gets broadcast about 10 times a second unless you turn it off. The Friendly Cookie Company can simply watch the airwaves with the monitoring software that usually comes with most WLAN cards to see what SSIDs are being received. Worst case, there's always NetStumbler.

As for running Part 15 vs Part 97: this will depend on whether you're running an A/P or your WLAN card on your PC/Laptop with a different antenna than designed by the manufacture (and approved by the FCC for use with said equipment) or possible running more power via amplifier. Both of these will pretty much cause you to be under Part 97. A recent ruling by the FCC has somewhat, but not completely, changed this with regards to antennas.

Wireless technology brings swift aid to Lancaster flood victims

10:16 PM CDT on Monday, August 2, 2004

By HERB BOOTH / The Dallas Morning News

LANCASTER -- Volunteers from various agencies descended on Lancaster almost immediately after last week's flooding. And one brought machines that carry data and speed emergency funds to flood victims.

Equipment worth more than $150,000 fills a souped-up Ford Excursion called the American Red Cross Emergency Communications Response Vehicle.

From the back of the Excursion, information is encrypted and bounced off a satellite dish at Lancaster First United Methodist Church and then to a Virginia credit card company. The volunteer then swipes a credit card, which places emergency aid money on the card, and that card is handed to the flooding victim.

truck

Edmund Fountain / DMN

The techno-truck that carried data-transmission equipment to Lancaster flooding victims is one of nine used by the Red Cross in the United States.

The credit card can be used to purchase food, clothing or shelter.

More than a foot of rain fell in eight hours late Wednesday and early Thursday. The deluge damaged or destroyed 115 homes, totaled 107 vehicles and caused about $6 million in damage. State and federal officials will know

late this week whether the area qualifies for national assistance.

Volunteers now take a laptop and a cellphone to a disaster site instead of reams and reams of forms. The volunteers download information via Wi-Fi technology, or wireless fidelity, a high-speed data-transmission system that allows users to access the Internet without data lines.

It's only the second time the Red Cross has used Wi-Fi. The first time was after June flooding in New Jersey.

Anita Foster, a Red Cross spokeswoman, said the techno-truck was nearly completely paid for with donations. It is one of nine across the country.

Five Red Cross teams were feeding into the truck's data banks Monday. Ms. Foster didn't have the exact number of credit cards issued, but she said whatever the number, it was infinitely quicker than the manual system that preceded the Wi-Fi technology.

Georgia Lohner, the Dallas Action Team coordinator for the American Red Cross' Dallas Chapter, said the system is incredibly agile.

"There's no duplication of effort," she said. "It also lets us know where the people are who haven't been seen yet."

Ms. Foster said the system also allows the Red Cross to update the card if more emergency funds are warranted.

"It also takes some of the stigma out of having to tell anyone that you're a victim," Ms. Foster said. "With the credit card, you hand it to them, and they just scan it, instead of carrying the papers with you."

Setting the SSID with you call is super if its an AP, but a client or bridge doesn't have an SSID for you to set. Some hardware allows you to set a device name, and that could be used. But to keep down the bandwidth, I tunr off broadcasting and only use an ICMP ID.

Chris,

Surely, I'd be willing to do it if nobody else steps up. Warning, the one we did at the Garland club goes long, abt 1 hr 45 min. And unfortunately, it just takes that long.

206. Bridging experiment

Yahoo group: DAWG-HSMM
Date: 2004-08-04 19:21:05 UTC
From: J. Beadles
Topic: 206 Message: 206

Whilst finally sorting out the eqpt we used at the Wild Ride and Hamcom, Doug Kilgore, Bob Kmak and I did some bridging experiementation using 2 WRT54Gs and one D-link DWL900AP+.

We were able to get one WRT54G and the DWL900 to bridge to the other WRT54G, and with one minor hiccup, everything worked pretty well. The hickup was that Doug's laptop was connected to the WRT54G running in AP mode, and that acted as the DHCP server with an IP of 192.168.1.2. When doug got an address from it, it set his default gateway to 1.2 also. My other WRT54G was set up as 192.168.1.1, and he couldn't ping it. I suspect it thought that the 1.1 address was outside the subnet and had no way to route to it. Other than that, everything went fine.

More complicated setups to come.

207. RE: [ntms-hsmm] Sveasoft firmware upgrade for WRT-54G

Hello everyone,

Has anyone noticed or tried to use Echolink on two different computers on their LAN using a Linksys Wireless-G router and have to manually adjust the port forwarding between the different ip addresses?

My router only allows 1 ip address for Application port forwarding, per port series.

So for example, my home computer may be 192.168.1.100 and my laptop 192.168.1.101 (using DHCP for addressing).

How can i solve this? Will the firmware upgrade solve this?

Leo

Leo, I am using a wireless setup and just have to go into the router config setup menu and select "advanced" then go to "forwarding" and set one ext.port to 5198 to 5199, UDP, enter the address of your pc, say 192.168.1.100, and click enable....
Go to the next line down and enter 0 to 5200, TCP, enter the address of the same PC, 192.168.1.100, and click the enable....
May not be the cleanest way to do it but it works.
If you want to add your laptop just fill in two more lines using the laptop address.
You might want to enter a discription of the control in the left hand block so you remember what it is for.
I have both my laptop and PC enabled at the router but you should only use one at a time.
I'm no expert but I got it working this way.
Good luck..
Bruce

Thanks Bruce. The problem I am having is the DHCP issues different ip's everytime. I suppose that setting a static would do the trick but the laptop also goes between office and home. the Dlink router we used was great. it let us use * for the ip address so it didn't matter what DHCP address was given. The Linksys doesn't have that * feature to my knowledge.

211. Wild Ride & 802.11b Presentation

Yahoo group: DAWG-HSMM
Date: 2004-08-08 19:15:18 UTC
From: Douglas Kilgore
Topic: 211 Message: 211

Doug Kilgore KD5OUG will give a PowerPoint presentation to the Richardson Wireless Klub about "WildRide and 802.11b".

RWK will meet Monday, Aug. 9, 2004 7:00pm at the St Barnabas Presbyterian Church, 1222 West Beltline, Richardson TX. Visitors are welcome.

If you participated in Wild Ride operations and will be attending the meeting, please wear your Wild Ride T-shirt.

215. Sources for IP67 "Harsh Environment" Ethernet Connectors.

Yahoo group: DAWG-HSMM
Date: 2004-08-13 23:18:52 UTC
From: Randall Dunning
Topic: 215 Message: 215

Here is some information on IP67 rated Ethernet cables and connectors.
For those of us doing E-Comm applications with 802.11 gear in less than
ideal WX such connectors might just be what the doctor ordered.

IP Rating Table
http://www.rlws.com/lit/load-cells/IP_ratings.html

The following carry the RJ Lnxx line of connectors (threaded):

AWC in Austin Texas (Cheapest I have found)
http://www.awc-direct.com/index.html

BB Electronics in Chicago, Illinois (best selection)
http://www.bb-elec.com/productlist.asp?dept_id=99

Spec Sheet:
http://www.bb-elec.com/bb-elec/literature/ENxxHarshDutyCables-0903.pdf

Catalog:

http://www.selectronix.co.uk/products/cac%5Ctechdocs%5CRJLnxxCat%20Aug01.pdf

The following carry the Amphanol (mid price) line of connectors (bayonet)

Metrix
http://metrix.net/metrix/products/parts

216. Cheap network equipment

Yahoo group: DAWG-HSMM
Date: 2004-08-14 06:07:53 UTC
From: J. Beadles
Topic: 216 Message: 216

Frys' has some really cheap Dlink eqpt this weekend...

An 802.11b router for $4.99 after rebate...
A DSL router with 4 port switch and USB print server for $29
An 802.11g router for $39 after rebate

BTW, I saw an interesting Linksys box at Best Buy - it's a networked storage device. You plug a USB hard drive and an ethernet cable into it. The box was somewhere between $79 - $99. A little pricier than I'd like, but about time somebody did it.

220. Securing the AP while providing a service

Yahoo group: DAWG-HSMM
Date: 2004-08-19 00:09:08 UTC
From: ulterior713
Topic: 220 Message: 220

Hello all,

I have some information that may be of some help for the upcoming Plano balloon fest. I have been running a 802.11b AP in my neighborhood for the last year or so. My ISP is Speakeasy and they actually support community wireless. I provide Web access at no charge to the users. What's interesting is that they are restricted in content and bandwidth. There is a need to protect from inappropriate content and prevent downloads of copyrighted songs. Since all content is send to my IP address, this is prudent from a legal standpoint.

I am using a old 300Mhz computer with 2 network cards and a Linux CD ROM known as Knoppix. Since the OS is completely on the CD, it's read only and impossible to hack by installing a rootkit. All software is open source and available free of charge. There are only three ports open for the public user level. Web access on port 80, SSL for secure Web on port 443, and port 110 for POP3 email. Logins are authenticated by a Radius server. There is a superuser level that allows unrestricted access for authorized individuals.

Security for the LAN is provided by using different subnets. My local address space is 192.168.x.x and the wireless clients are assigned by DHCP from a 10.10.10.x pool of addresses. Since WEP has known vulnerability issues, I decided to open up my AP to provide a community service and protect my LAN by other means. No hassles associated with WEP keys or SSIDs to be kept up with.

Information on the CD ROM is here:
http://www.publicip.net

My access point is an Engenius (Senao) 200mW mounted in a sprinkler system control box very similar to the one on N5OOM's HSMM projects page. It's powered using a homebrew PoE injector and a wall wart. Only one wire to go up the mast.

73,
Rick
W5TUX

221. Re: Maxrad 8db Omni antennas

Yahoo group: DAWG-HSMM
Date: 2004-08-19 15:56:03 UTC
From: J. Beadles
Topic: 169 Message: 221

All,

Sorry for the delay - it took a while to get solid contact info. The antennas are still available. There are at least 25 available and maybe more at $20 each.

These are taken out of service and are 2.4 GHz 8dB antennas (abt 2 ft tall) with a female N connector. They are believed to have a 6 degree electrical downtilt, so these are better for high mounting.

There is no mounting hardware, but the N connector is threaded for a bulkhead nut. The general idea is that you drill a hole in some angle iron and bolt the antenna to the angle by the connector.

I have requests for the following:

4 - N5OOM (John)
2 - KC5QHH (Randy)
3 - K5ZMJ (John)
2 - N5UDS (Gene)
2 - W5ADC (Tony)
2 - KD5YBI (Tom)
1 - N5UIG (Dee)

I may be missing some requests, so if your name isn't here, please remind me. Your best bet is to respond to the list rather than to my personal email. Thanks to N5SKE, N0XLR and KD5PQA for bringing these to our attention.

223. Low budget options for WiFi

Yahoo group: DAWG-HSMM
Date: 2004-08-20 00:08:46 UTC
From: Brett Neilson
Topic: 218 Message: 223

Thought we might be able to use these ideas for some additional equipment :)

Enjoy...

Tim,

I think so, though I'm notoriously bad about shipping stuff. You may have to whip me into getting it done. So, after I confirm that I have them, be sure to send me a reminder.

Y'know, I think that's a nifty idea. I have an unused 3" parabolic
that this could be done to.

Tony,

I will have two tents and MAYBE a trailer on the North end of the field. We will have electric there also. If needed, you can mount a bridge at that location and cover the field with no problem.

Let me know what you need and we can look it over.

230. Report on Plano Balloon Fest Field Test 2

Yahoo group: DAWG-HSMM
Date: 2004-08-24 02:41:10 UTC
From: radiorandr
Topic: 230 Message: 230

I would like to thank everyone for there help on Sunday to continue the testing of the WiFi system that we will be using to support the PBF. At the test we erected an approximately 25 ft mast at the proposed location of the festival com trailer. At the top of the mast was installed a WAP11 access point and a webcam. The WAP11 was equipped with a 6 dBi antenna pointed toward the field. At the far end of field was installed a WET11 and another WAP11 configured as a bridge. This equipment was configured to provide coverage in the kid's play area and as a possible location for a Webcam. Additionally attempts were made to provide access points and webcams at two other locations.

Lessons Learned (in no order of importance)

1. It's beginning to get dark sooner. We started at 7:00 pm and by 8:30 pm it was really beginning to get dark.
2. We need to preplan our IP addressing a little better.
3. Any equipment we use will have to be robust and be able to operate unattended unless other special considerations are made.
4. We need to plan of multiple Internet feeds into the facility. Purely online has agreed to provide the feed, but we may have trees in the way.
5. It looks like the webcams may be the hardest part of the whole project.
6. The AS2236 mast systems will probably need ballast on the feet to prevent nervous looks at the antennas. A few close guy wires might also improve the look of the system.
7. All equipment not located at the comm. trailer should be battery powered. The battery system should supply at least 8 hours operation with a secondary battery available.

Recommendations for network configuration at the Plano Balloon Fest

IP Addressing Scheme

The following is the recommended network IP addressing scheme. I will assign all IP addresses before the event. Please contact me if you would like to supply equipment. The following is a preliminary list. Suggestions are welcome.

192.168.1.1 Main DHCP Router (W5ADC)
192.168.1.2 Main AP WAP11 located at the comm. trailer (W5ADC)
192.168.1.3 Local Repeater (N5OOM)
192.168.1.4 Remote Bridge (W5ADC)
192.168.1.5 Remote AP (W5ADC)
192.168.1.6 ☐

192.168.1.7 ☐
192.168.1.8 ☐
192.168.1.9 ☐
192.168.1.10 -

192.168.1.11 IP Camera 1 (Comm Trailer)
192.168.1.12 IP Camera 2 (Field Entrance)
192.168.1.13 IP Camera (Kid's Area)
192.168.1.14 ☐
192.168.1.15 ☐
192.168.1.16 ☐
192.168.1.17 ☐
192.168.1.18 ☐
192.168.1.19 ☐
192.168.1.20 ☐

192.168.1.100 Series Local Computers

Wireless Channel Assignments

The following are our working wireless channel assignments.

Channel 1 Primary AP
Channel 11 Remote AP

If repeaters are used they will repeat off the primary channel if possible.

We believe that another user will be utilizing channel 6 during the event. We will investigate at the time the event begins.

Webcams

We will plan to cover three primary areas during the event. Below are the primary locations and the equipment to be provided.

Main Field It will be desirable to have a high quality camera equipped with a zoom lens and pan/tilt head. A control panel in the trailer can manually operate these controls. If required the camera can be interfaced with a computer that will be supplied as part of the networking equipment.

Field Entrance This camera will be positioned at the field entrance to monitor the balloon as they enter and leave the field. It will be desirable for this system to be self contained, battery powered and provided in a weatherproof housing. The equipment can be located with the bridge system that will be at this location. An IP enabled camera will be desired.

Fun Zone This camera will be used to monitor the Fun Zone at the PBF. It will be desirable for this system to be self contained, battery powered and provided in a weatherproof housing. The camera will be located remotely from other network equipment. It should be

equipped with a WiFi interface.

Refueling This camera is likely to be interconnected to the comm. trailer via a 70 cm wireless link. After being received at the comm. trailer the signal will be digitized and transmitted over the Internet.

These cameras will have to be extensively tested before the event. Also, a webmaster will have to be appointed to work out these details.

The image size and frame rate will also be standardized to 640x480 and one frame every 5 seconds. It will be desirable to store these images for the duration of the event as a record.

We will likely have another meeting in the next few weeks. In the mean time I will be confirming with various individuals their specific assignments in support of this effort.

Thanks,

Tony
W5ADC

234. Networked Webcams at Best Buy

Yahoo group: DAWG-HSMM
Date: 2004-09-09 03:59:55 UTC
From: J. Beadles
Topic: 234 Message: 234

Best Buy has rebates on the Dlink DCS-900 (wired ethernet) and DCS-900W (802.11b). These are the small webcams, details at:

http://www.dlink.com/products/category.asp?cid=60

The DCS-900 is $99 with a $40 rebate, the DCS-900W about $20 more. I picked up a DCS-900. The lens is not replacable for other lenses. Also, it appears that it does not provide a frame FTP option. However, it does display a frame on the units main web page, and a separate perl application could be written to periodically get that image.

235. Re: [ntms-hsmm] Networked Webcams at Best Buy

Yahoo group: DAWG-HSMM

From: Ron Cole
Topic: 234 Message: 235

Do you not have direct access to the Webcam Image?

I use curl to fetch an image from the camera once a
minute and post process it keying a Title on the image
then posting it on a Webpage.

The FTP "Client" in the dLink DCS-1000 camera was/is
useless and the Server PC cron job was the only
soultion.

By the way the Video is really lousy. But then I come
from a TV Engineering/Professional Film Photography
background. So I expect more from a camera.....

I guess for >$200 on a Web Cam you cant get much of a
picture. From what I can tell I have to spend <$1000
to get a decent Web Cam so I won't own one any time
soon.

237. Plano Balloon Fest HSMM Meeting

Yahoo group: DAWG-HSMM
Date: 2004-09-12 02:20:16 UTC
From: Anthony Campbell
Topic: 237 Message: 237

Just as a reminder, there will be a meeting tomorrow, Sunday September 12, at 1:30 pm. The meeting will be at the launch field. The following will be primary objectives of the meeting:

1. Finalize the installation of the link from the model home to the field.

2. Test coverage and install a bridge as required.

3. Pick final locations for the webcam and test interconnectivity.

4. Finalize wireless security plans. Most likely we will us MAC address filtering.

5. Finalize assignments of IP addresses.

6. Test ATV link.

7. Get committments for technical assistance and support during the event.

Well that sounds like enough for this meeting. I hope to see you all there tomorrow.

Thanks,

Tony

From: J. Beadles
Topic: 224 Message: 240

All,

Sorry for the delay! Balloon Festival related activities have me
working overtime. Anyway, I did finally pick up these antennas.
They are as advertised, but with a 7 degree downtilt. Here's a
potential catch - My source does not know for sure, but believes that
the antennas are supposed to be hung upside down from the ceiling so
that the downtilt points that way.

Anyway, I have the 12 in my posession.

Brent,

If your buddy still wants some, I'll pick them up after I recoup some
of the funds from this set.

242. Maxrad Antenna Info

Yahoo group: DAWG-HSMM
Date: 2004-09-15 15:02:14 UTC
From: Randall Dunning
Topic: 242 Message: 242

The Maxrad XtremeWave MFB24008DT7 is the antenna that is being made available
and if you consult the Maxrad Webpage,

See:
http://www.maxrad.com/cgi/maxrad_products_ind.cgi?product=10068&catalog=10002

you will discover that the "7 degree down tilt" is 7 degrees toward 90 degrees.
Since, by convention, 90 deg. is considered "UP" in antenna elevation plots, the antenna signal pattern is canted toward the top of the whip by 7 degrees.
Thus the antenna must be mounted upside down to work properly. This should not
be much of a problem since most of the NMEA boxes we are using have the mounting
holes on the bottom. The vertical antenna pattern plot is available at:

http://www.maxrad.com/cgi/images/products/patterns/XtremeWaveOmniPatterns.pdf

The product flier for the MFB24008DT7 can be viewed at:

http://www.maxrad.com/cgi/images/products/pdf/XtremeWaveMFBOmnis.pdf

For those who have not figured it out already, the Maxrad nomenclature for this
antenna is:

MXB - Series
2400 - Frequency
8 - Horizontal gain in dB
DT7 - Down Tilt 7 degrees (when mounted inverted)

In addition, the $20 price tag is quite a deal as they can be ordered from the
usual suspects for around $75.00 USD. These antennas are pretty beefy and appear
to be genuine "industrial grade" antennas as opposed to some of the PVC wonders
floating about on Everyone Bids Against You.

Many thanks to John (N500M) for putting his lasso on these rascals.

Thanks to Tony W5ADC, Doug KD5OUG, Kevin KD5YVL and Bill K2CHP for working network issues and webcams at Balloon Festival. The network was instrumental in determining whether or not to fly the Saturday night flight by allowign access to weather radar. Not everything worked, but we are still working hardware and logistics issues. Tony, if you get the chance to write up a post-event report I'd sure appreciate it.

Thanks again all!

Hi Doug,

I would like to invite you and your group working on Amateur Radio wireless networking to have a FREE table at the ARRL NTX Section Mentorfest that we're planning to have on October 23rd in Irving, TX. Check out the web site at http://www.ntxinfo.org/mentorfest/ for more information. This should be a good opportunity for you to show off what you've been doing and perhaps get some other people interested.

If you're interested, just let me know and I will reserve a table for you.

73,
Roy - AD5KZ

Yeah, Roy dragged me in for the APRS presentation side of the house.

251. Information on Slotted Wave Guide Antennas for 802.11b

Yahoo group: DAWG-HSMM
Date: 2004-09-24 20:20:04 UTC
From: Randall Dunning
Topic: 251 Message: 251

There is an excellent article on Slotted Wave Guide Antennas
that has plans, horizontal and vertical pattern gain diagrams,
and gain charts. There is also a nifty animation on how these
things work.

Directional SWG antennas may be just the ticket for low
cost sector antennas that can be used to experiment with
slaying the noise dragon that has manifest at the last couple
of HSMM supported public service events.

253. Plano Balloon Fest 2004 After Action Report

Yahoo group: DAWG-HSMM
Date: 2004-10-02 01:40:48 UTC
From: Anthony Campbell
Topic: 253 Message: 253

After Action Report
Plano Balloon Fest 2004 HSMM Activity

As part of the amateur radio communications support for the Plano Balloon Fest 2004. Our primary goal was to provide an Internet connection to allow for real time weather updates during the event. Additional goals were to position several web cams at the venue to monitor critical area and to provide a simple means to interchange files within between several locations including APRS data.

The configuration consisted of an access point located at a model home near the venue. This was interconnected to the provided cable modem router used at that location. Yes, permission was given. We then installed a Linksys WET11 on a 25 ft mast over 1000 foot away. Local computers were then connected to the WET11 via a switch. All of the equipment was operated under Part 15. This was established and while not the fastest connection in the world it did work just fine.

We did encounter some interference from a 2.4 GHz cordless phone at the model home. This issue was resolved by changing from channel 1 to 11. We then connected a Linksys WAP11 to the switch. This is when the real problems began. Even though the WAP11 was configured to operate on channel 1 there seemed to be some interference between the two devices. Even after replacing the WAP11 we still encounter the same problem. Since it was getting close to the time of the event we abandon using the WAP11. The other computers that were required to be connected were close enough to hardwire them. With this operational we were to accomplish our primary goals.

This problem is puzzling, because several days before the event the same equipment was used and it work flawlessly but on different channel assignments. This issue will require further investigations.

We were able to establish four web cams for the event. Two of the cameras were connected to the local switch and the traffic routed over the wireless link. One camera located on a adjacent building and this was routed to the event website. The last camera was used

on the field. It directly connected to the model home access point.

What did we learn? There is a reason for having both commercial and home equipment. We suspected that we were having some heat related issues with some of the equipment. It was pretty obvious that we were having mutual interference issues. This should not have been an issue due to both physical and frequency separation. We could have attempted to use some more directional antennas, but this would have violated part 15. During the course of the event we also attempted to establish a internet link via a 900 MHz internet provider. This did not work due to the trees that blocked the path. In conclusion, we did accomplish our primary goals for the event but this was not without unexpected issues.

255. Re: [ntms-hsmm] Re: Mentorfest

Yahoo group: DAWG-HSMM
Date: 2004-10-11 18:35:48 UTC
From: Douglas Kilgore
Topic: 249 Message: 255

I'm back from vacation.

For the HSM part, I propose that we have a laptop showing pictures of some of our installations at events. I have a bunch of pictures as do others. In addition we could have several of the antenna/accesspoints on tripods just to show what can be done.

We could also set up a live wireless internet connection if there is a high speed connection in the building or availble from outside.

Who has been in contact with the folks setting up the room?

256. Need HSMM Help with Mentorfest

Yahoo group: DAWG-HSMM
Date: 2004-10-17 21:11:04 UTC
From: Douglas Kilgore
Topic: 256 Message: 256

This coming Saturday, Oct. 23, the North Texas Section ARRL is sponsoring Mentorfest. Time is 8:00am - 3:30pm.

http://www.ntxinfo.org/mentorfest/

There will be an NTMS-HSMM table demonstrating HSMM. I need help in setting up a 802.11b network, connecting it to the internet and then in explaining to visitors how it works.

I would like to have at least 2 webcams uploading pictures to the web on a realtime basis.

I need volunteers with equipment and time to man the booth.

Please respond immediately as we will need to plan our network.

That's an interesting thought. From your house, can you see the top of the 4 or 5 story bank building that's just accross the parking lot from Betcha Bingo?

I will be setting up a table with HSMM microwave equipment. I expect to have a live internet feed brought in from a outside source. I will know for sure on Thursday afternoon.

I hope to have wireless internet coverage for the whole Mentorfest area. So plan on having a laptop computer to show off the NTMS web page.

I would hope that our two tables could be side by side near the front of the building near the windows.

The article on the WiFi distance record is interesting also -
http://www.wifi-toys.com/index.php

Using 2 Orinoco cards at the feed points of two 9 ft satellite
dishes, got 55 mi without amplification. This is reasonable - back
in the old days when I did microwave path design, we commonly used 10
and 12 ft dishes for 4GHz and 6GHz.

Yep, them's the good old days. :-)

Most of my stuff was done around '89 to '92. Shortly after that, the
hundreds of microwave paths my co. owned were decomm'd in favor of
fiber.

264. HSMM Internet Feed at Mentorfest

Yahoo group: DAWG-HSMM
Date: 2004-10-22 14:33:09 UTC
From: Douglas Kilgore
Topic: 264 Message: 264

We expect to have a Wireless Internet feed in Irving, TX at the NTX ARRL Mentorfest on Sat., Oct. 23. which will be open to all. In addition, we expect to have a webcam uploading realtime pictures to the internet.

Pictures will be viewable worldwide at
http://home.comcast.net/~kd5oug/mentorfest.html

All hams are invited to use the wireless connection so bring a wireless enabled laptop.

VoiceLine XJ100 Wi-Fi Handset

The XJ100 enables users to place and receive low-cost VoIP calls over a Wi-Fi network.

Suggested Retail Price: $175
(does not include cost of shipping from the U.S. and any tariffs, duties, or import taxes)

The VoiceLine XJ100 Wi-Fi Handset:

a.. Allows users in corporate, residential, and public Wi-Fi network environments to benefit from VoIP calling
b.. Complies with both the 802.11b and 802.11g standards for Wi-Fi LANs
c.. Supports value-added features such as VoiceMail, Caller ID and call forwarding
Opportunities for Savings
The XJ100 Wi-Fi Handset enables users to place and receive low-cost phone calls over Wi-Fi networks. Users no longer need to access a wired network to benefit from VoIP calling. Callers can save in any number of Wi-Fi network settings, including:

? Corporate Environments: Larger businesses are increasingly using Wi-Fi networks to extend their wired networks to off-site/telecommuting employees in home and satellite offices. With this solution, corporations can reduce the communication costs associated with establishing remote offices.

? Small Businesses: Many small businesses rely on the flexibility of Wi-Fi networks to meet their ever-changing infrastructure requirements. Net2Phone enables these companies to utilize their Wi-Fi networks to save on communication costs.

? Residential Settings: Users can now utilize their home Wi-Fi networks to save on their telephone calls.

? Free Public Hotspots: Callers can take advantage of the rapidly growing number of free public hotspots to make and receive low-cost calls when they are away from their home or office. Travelers can save by making calls from airports and hotels around the world.

? Campus Environments: Students can make and receive calls throughout a Wi-Fi enabled campus.

? Municipalities: Public officials in locations with Wi-Fi public safety networks can make and receive calls from all over town.

Standards-Based Compatibility
With the XJ100, calls can be made through Wi-Fi gateways and access points that comply with either the 802.11b or 802.11g standard. Both standards apply to Wi-Fi LANs operating in the

2.4 GHz spectrum.

Feature-Rich Calling Solution
The XJ100 utilizes Net2Phone's VoiceLine service, enabling both inbound and outbound calling and allowing users to choose from a U.S. local, U.S. toll-free, or U.K. toll-free telephone number, no matter where they reside globally.

The XJ100 supports a wide range of value-added features, including:

a.. VoiceMail
b.. Call blocking
c.. Caller ID
d.. Call return
e.. Call forwarding
f.. English or Spanish language selection
Product Specifications

a.. Dimensions: 5.5" (H) x 1.9" (W) x 0.8" (D)
b.. Weight: Approximately 111g
c.. Battery Life: 3.2 hour talk time, 21-23 hour standby
d.. Notification: Ringer/Vibration
e.. Ports: Earphone jack

System Requirements

a.. A broadband Internet connection (such as DSL, cable, or T1) or full 56K dialup (with default bandwidth settings)
b.. Access to an 802.11b or 802.11g wireless network
c.. Most broadband Internet connections use dynamic IP addressing (DHCP), but if your WAN uses static IP addresses, you will also need the following information for the XJ100 Wi-Fi Handset (available from your broadband service provider or LAN administrator):
IP address; Netmask; Gateway address; DNS server address

*Price is quoted in U.S. dollars and does not include items such as shipping, tariffs, duties, and import taxes. Suggested retail pricing should be used as a guideline and can vary by market. Net2Phone reserves the right to refer you to a local distributor to purchase our hardware products and calling time.

>
Cool phone. It seems to be the same unit sold by ZyXEL as the Prestige 2000W for $250. Net3Phone's price seems quite reasonable at $175. A full teardown and firmware info it a the Seattlewireless.net website. URL:

http://seattlewireless.net/index.cgi/ZyXELPrestige2000W

Supports ad-hoc networking and can do IP to IP calling without any central SIP server. Of course to use this mode DHCP would not be practical and IP addresses would need to be static otherwise every time the phone is powered up a new address would be issued.

Although not stated in the specs, I assume that each device transmits it's MAC so filtering could be put in place to prevent "rouge" devices from accessing the network.

Secure, reilable comms and full duplex as well. Not bad at all.

269. 802.11 Demo at NTMS Meeting

Yahoo group: DAWG-HSMM
Date: 2004-11-06 18:44:49 UTC
From: Bob and Debbie Kmak
Topic: 269 Message: 269

Guys,

We are planning to do an 802.11 demo at next Saturday's (Nov. 13) North Texas Microwave Society meeting. It will be in Ft. Worth, at the Lockheed Martin Recreation Center.

Does anybody have any ideas for an effective demo, outside of the usual NetMeeting hookup? We will be in a first-floor meeting room, so going outside for the demo should be pretty easy, if that would help. We've never had our meeting at this location before, so I don't know what might be available in the area (like hotspots). If any of you would like to participate, your help would be very appreciated.

Bob Kmak

Bob,

Looks like I, Doug KD5OUG and Ken KD5ZXG are going to try to put
something together, though it likely won't be much more than a bridge
link, an access point link and a web cam or something. If there is a
local connection we can try to bridge to it, but won't count on it.

Is anybody else interested in helping out? Strongly recommended that
parties interested in HSMM attend.

271. Proposed HSMM contest

Yahoo group: DAWG-HSMM
Date: 2004-11-10 19:50:46 UTC
From: J. Beadles
Topic: 271 Message: 271

All,

Whilst driving back from an HSMM presentation to the McKinney club last night, KD5OUG, KD5ZXG and I were discussing ways to build up some to build up some activity here in the North Texas area. One thing we considered was setting up one or more contests that would require participants to connect to the NT5NT access point here in Richardson.

To do this, we will need to rehabilitate the AP that is currently on the tower, changing out the AP to a WRT-54G, installing a high gain H-pol slotted waveguide omni and finding an internet feed. We are soliciting volunteers to help us build and configure this equipment.

We are thinking the the contest would require users to access a particular web page through the ap, possibly input their GPS coordinates and obtain a unique serial number as proof of completion. Farthest distance would win. Another idea would be a would be a "worked all zip codes" contest.

We are soliciting comments on different types of contests, the win conditions and ideas for conditions that could be used as score modifiers.

John,

Sounds good. I've asked my contact with the LMRA, Doug Howard, about possible internet connectivity at the Rec Center. He said there was nothing available. But he added that it might be possible to connect to the apartments 'across the river' to get an internet connection. He added that that's what they do at Field Day. If you like I'll pursue this further with him and try to find out if it's feasible (and legal :-).

Bob

273. Items of Ham Interest at Harbor Freight Sale

Yahoo group: DAWG-HSMM
Date: 2004-11-11 07:03:26 UTC
From: Douglas Kilgore
Topic: 273 Message: 273

I received in the mail a Harbor Freight sales brochure for a sale that ends Dec. 6.

Two items of interest for hams:

1. Suction Cup - 4-1/2 inch diameter. $2.49 This was shown in QST article for mounting antenna on glass.

2. 12 volt Jump Start system and Power Supply. $39.99
17 amp hour battery, spot light, meter, auto shutoff and jumper cables

Harbor Freight stores:

1704 E Beltline, Richardson
1735 N Story Rd, Irving
5268 Trail Lake Dr, Ft. Worth

Merry Christmas

Doug Kilgore KD5OUG

274. North Texas Microwave Society Meeting This Saturday

Yahoo group: DAWG-HSMM
Date: 2004-11-12 02:25:13 UTC
From: Bob and Debbie Kmak
Topic: 274 Message: 274

This month's meeting will be at the Lockheed-Martin Recreation Center in Ft. Worth Texas.
We will be guests of the Lockheed-Martin Radio Association.

The meeting will be held in the clubhouse, Meeting Room 1 (Liberator). As you drive up to the grounds, you will have to tell the guard that you are there for the radio club meeting. He might subject you to a quick CW test, but I hear he's pretty lenient (Just Kidding!) See the October VP's letter for details at http://www.ntms.org/ click on October VP .

The informal part of the meeting will start a 12 noon.

Then at 1 PM, the official festivities will begin:

1. Discussion of future direction of NTMS; including what to do about lagging activity, fading newsletter. Bring your best ideas.

2. MUD 2004 Report, by Bob Gormley, WA5YWC.

3. Show n' Tell , starting with the recent 10 GHz & Up contest
a. Al Ward, W5LUA, will give his observations on the contest.
b. WA5YWC, K5WO, NM5M and others will tell of their exploits during the contest.
c. Open Mike session for anyone who wants to tell of interesting ham radio activities or purchases.
Most of us buy some ham radio junk through the year; if nothing else just say a few words about the neat stuff you've added to your collection.

4. Joe, N5PYK will give a demo of his new software program, AvTrakMap

5. 802.11 Demo, by John, N500m, Doug, KD5OUG, and Ken KD5ZXG.

6. If time permits, we will adjourn to the LMRA club station and check it out.

See you Saturday!

Bob Kmak K5WO
NTMS VP

I don't believe the time is right for a "contest" that is associated with a "fixed" AP. Traditional "challenge" standings, such as distance, data rate, path quality (distance x data rate), rovering setup/teardown times, rovering grids worked, etc. might be better. In this way, Hams who don't live in the immediate Richardson area could participate and not be limited by an exclusive AP.

The "challenges" might be associated with VHF/UHF contests. Many of us are interested in HSMM but don't have the equipment or know-how. By tagging along with a test or rover, we could learn more.

Some guidelines would need to be developed to confirm the results and could be published on the NTMS site. An award in the form of a certificate, plaque or cup could be presented to those who break standing records. I would suggest the Standings Coordinator issue a certificate and allow the winner to pay for a nice plaque or trophy with the certificate image engraved or screened onto the plaque, etc. That would keep the costs down for the NTMS and allow bragging rights for the individual.

Well, that's my 2-bits (a little digital talk),

From: Frank Krizan
Topic: 278 Message: 278

Howdy,

A friend of mine in the Houston area desires to setup an 802.11 link between his house and his son. It's about a 5 mile path. What would he need at both ends to pull this off?

He's looked around some of the HSMM sites and found that a lot of people are using the LinkSys WRT-54G. What would he use for coax? An antenna?

Any thoughts on configuring the equipment? ... namely, LinkSys setup.

Thanks and 73, Frank KR1ZAN

John,

I'd be interested in a competition of some sort. I would suggest a long time period, like 2 weeks, to give everybody a chance to get out and try their luck. Also, I'd suggest using 6 digit grid squares as multipliers (if it's reasonable to assume that everybody will have a GPS) , and maybe have county and zipcode multipliers if you want to get crazy. Each connection could be awarded points based on distance - there a free programs available that will calculate distance between grid squares. Participants could make as many connections as they want as long as each connection is made from a unique location or gridsquare (so you couldn't sit in one place and make a zillion connects for points).
Final score would be total distance points times multipliers.

Maybe the web app could calculate the distances. Also, perhaps the web app could also display a running scores tally.

73,

Bob

I can certainly see this in the future, but for right now the goal we
are thinking of is just to get the local area org mobilized, hence
the focus on the NT5NT repeater. However, there is nothing
preventing us from expanding contest idea.

Frank,

Assuming that they are both licensed and running in part 97, look at the KC5QHH pics on http://www.n5oom.org/hsmm/. The radios need to be up at the antenna. Cable pigtails can come from FAB-CORP, maybe 14dB antennas at each end, but remember the higher gain antennas, the narrower the main beam and so the less environmental interference they will see. They will want to run ethernet cable to the radio, and just run power over ethernet to the radio. The relevant manufacturer links are on my web page also.

I'm forwarding this message from the Winlink2000 Emergency Communications reflector because of the mention of an 802.11b link in the last paragraph. Winlink2000 with TelPac is what the ARRL is pushing for digital communications. This message is one of a long thread on the subject of priorities and thruput.

It describes where HSMM might fit into the picture.

If you want to know more, go to:

Interestingly enough, when I mentioned the capability of TelPac to a couple of emergency managers last weekend, they both said NOW WAY are we going to allow our units in the field have direct access to the Internet...we want all messages going through our EOC before going up-channel.

Now as far as ARES having that capability...its a good idea but I'm seeing that local goverment EOCs (and probably the state EOC) don't want TelPac capability.

Harris County (Houston, TX) is implementing WinLink 2000 for EmComm. Collin County (Plano, TX) is investigating it.

Walt, I've heard similar things from emergency personnel about Ham Radio. "We don't need some amateurs when we can do everything using cell phones."

Topic: 284 Message: 287

Of course understand the emergency manager's position...if someone in the field sends a request to the state for some sort of assistance and the local emergency manager already has the situation under control, this "waste" effort and might obligate the local emergency manager/city to spend funds that they did not need.

An close example of this was a South Texas ham who indicated he was sending a request from the country emergency manager to the state for highway barricades. The state started contacting various close counties to obtain the barriers and dispatched an 18 wheeler to the various counties with access barriers to carry them to the south Texas county. They weren't needed. The message from the county emergency manager was to the local city government and never ment to be sent via ham radio...the ham took it upon himself to send the message.

So to prevent "un-authorized" communications, many larger EOCs prefer to have all communications authenticated by the regulating EOC manager/manager's staff prior to forwarding a message up.

As one who has sat in an emergency operations center as a controller, I have to agree...I want all up channel messages to filter through my office and reviewed by me or my staff.

However, once again, if an ham wants to run TelPac for the benefit of local ARES stations and the customers they represent and the customer needs that service, then that is another situation.

I just believe that operating a TelPac station is not necessarly an EOC function. If however the EOC looses Internet/E-Mail capability, then the use of an ARES provided TelPac station is of benefit.

Yes those who say ham radio isn't needed haven't much emergency communications experience. During the recent hurricanes, the Texas Baptist Men and their feeding kitchens, chanisaw crews and clean up crews found that daily cellphone and even telephone contact was difficult and non-existant even several days after the passing of the storm. They relied on HF to keep in contact between their "deployed" locations and "home base" back here in San Antonio.

Topic: 284 Message: 288

Another Emergency manager that does not understand
emergency communications systems.
The last thing you want to do is depend on a Cell
Phone in a Disaster Situation.
Cell Phone systems suffer from overloaded and
Congested Systems, A dependency on Phone Lines to the
cell site, as well as Power outages that can take the
site off the air, many Cell Sites don?t have long tern
backup power, and you have a system the simply cannot
be depended on in an emergency.

As for WinLink 2000 I don?t care for any technology
that relies on special hardware and other Unreliable
Technologies as this system does. If all goes well
this system will work but with only one supplier of
expensive equipment I?m not impressed. I wish more
thought was put into this system before making a
decision on the technologies being used?

For an excellent presentation on Winlink 2000 and associated sub-systems, given by Jon Brown, WB5KSD, to the Telecom Corridor Council of Clubs on November 1, 2004, link to http://www.qsl.net/w5vv Select the article in the table to the left.

HF is only one part of the Winlink system. VHF and UHF are a vital part and would most likely be used to provide access between an EOC or emergency center and an access point linked to the Winlink system via an Internet connection. The typical "operator terminal" is a laptop running Airmail software connected via a serial port to a TNC and 2m or 70cm radio. The access point is similar, but, the AP computer is further connected to the Internet. Yes, in really tough cases, the link could be via the HF path. Other links could be via an 802.11 path or portable satellite internet.

I do not think that the second paragraph is entirely true. Most likely they either have not been approached or do not know what Winlink and TelPac are. My Emergency Manager looks for his RACES team to give him guidance and keep him abreast of advances in amateur radio. Houston and Austin both have strong digital infrastructure where as the D/FW outside of APRS has a poor digital infrastructure. This has a big impact on the success of Winlink.

Sorry about having EM's with that "keep it close" attitude. Here in Garland, the RACES group has been invited to participate in the testing of the city's 802 infrastructure. Internet access and all from your vehicle.

The entire topic of WInlink and TelPac need a better exposure here in NTexas and some Champions. The Dallas County RACES council has only once discussed WInlink.

If a Winlink expert is out there and wants to present a talk, I will be pleased to schedule this for a Garland ARC meeting. I am currently handling the programs. Give me a call.

John,

Reference the program given on the AARA website http://www.qsl.net/w5vv

Jon is very qualified to give the program.

73, Frank

John,

The Winlink guy the CCARES guy is talking to is out of Farmersville
and gave the discussion to the Telecom Corridor ARC meeting. The
CCARES is seriously interested about the WinLink2k / Telpac system,
and this person offered to reconfigure his system so that we could
test it. Let me get you in touch with N5BYL and he can point you to
the person.

John,

Sorry about carrying this string so long, just look at qrz.com for Jon's email address.

John,

The Winlink guy the CCARES guy is talking to is out of Farmersville
and gave the discussion to the Telecom Corridor ARC meeting. The
CCARES is seriously interested about the WinLink2k / Telpac system,
and this person offered to reconfigure his system so that we could
test it. Let me get you in touch with N5BYL and he can point you to
the person.

There are many network problems associated with WinLink. One is that there is only one MBO operating (in the mid-West) and it does not have an automatic fail back to another system. The backup system located in San Diego must be manually turned on and if it could be remotely turned on, if the Internet failed at the promary PMBO, then how odo you know to tunr on the backup.

Most if not all of the personal MBOs have a FQDN assigned by no-ip.net and depend on no-ip to convert their dynamic IP address to a FQDN. AS we have seen locally, if the local broadband provider has problems, the DHCP lease may not last long and in fact I have seen new IP addresses assigned each time the broadband resource went down...during the last storm, I got 3 different IP addresses in 8 hours.

These are just a few of the problems.

The system is very hackable using telent on an "odd" port as a way to deliver "traffic" to the MBOs.

Finally, while Ron's point about the proprietary mode (SCS's Partor III), we need to understand that on a poor CCIR Channel and at a low SNR (-5 dB SNR) Pactor III produces a lower throughput than MT63 and at a 0 dB SNR, only slightly better throughput.

While I think that the WinLink system can serve as a proof of concept model, I don't think it it one that serious emergency managers would want to depend on.

What we need to undertand as amateur radio operators it that trying to produce high-speed, robust HF modems in a 3 KHz wide channel is self defeating...we can produce high-speed or robust modes; but, not both. To produce a true high-speed, robust mode, you need somewhere between 6-10 KHz wide channels...and this is presently NOT in the ARRLs band plan.

What is really strange is that one of the main proponents of WinLink is also the chairman of the Digital Committee that has proposed only 3 KHz data channels.

Before committing time and resources into WinLink, I think we all would be well served to step back and take a good hard look at the technology proposed. I know that several individuals from the DFW area attending the DCC this year understand this problem and I hope that they will speak up on the problem.

Does anyone have any suggestions for the following:

Basic enclosures

Weather proof ethernet connectors

Low cost 12 VDC to 5 VDC switching power supplies

Thanks,

Tony
W5ADC

Try the Pacific Wireless RooTenna. They advertise that it meets NEMA-4 requirements and has a built-in 14 dbi antenna and a waterproof CAT-5 gasket. It even has a mounting bracket.

Tony,

Here in Paris, TX we are running an HSMM System using a LocustWorld Meshbox software with Mac Authentication. We are using a sealed fiberglass enclosure a little larger than 9x11x5 with a 12v Via logic board that requires no fan. A regulated 15 volt laptop power supply is used for a power source within 50 ft to a transistor inside the box which converts it to 11.8v solid. The specs of the logic board does not allow us to run over 12.4V i think so the regular astron power supply will not work at 13.8v.

A Cat-5E cable is used for the ethernet connection to the internet. It is a UV protected buriable type cable and runs directly into the bottom of the box with strain releif. Coax to the antenna is kept to a minimum this way by having the box mounted to the lower half of the antenna mast or tower top section. We run LMR-400 or LMR-600 depending on the antenna we use.

Our system ERP is within the Part 15 regulations for commercial systems and it seems to have a line-of sight coverage of 5-15 miles depending on what antenna is used on the other side. I have experimented with a 7dBi mag mount antenna, an SMC 200mw PCMCIA card and have been able to reach the system from all but 1 spotter location here. Those are within 5 miles.

Most of the equipment came from Digikey.

Leo,
If the Astron power supply is a linear style rather than a switcher, there is a variable resistor in the circuitry that can adjust the output voltage in some cases over quite a range. You might try that. Sorry I don't remember the reference designator of the pot, but its easy to find on the schematic.

Other than that not must to say. We're using a 3deg down tilt 12dBi omni for it and just moved it to it's own pole this weekend to test range. The Meshbox can run on any Pentium class computer with 128 megs of ram and used 32megs of hd space. Software is free on the internet. www.locustworld.com

I have a switching supply here but the laptop computer brick is great.
The whole thing runs at less than 60 watts. I think somewhere they
figured the total power draw one booted was only .4-.5 amp.

From: J. Beadles
Topic: 296 Message: 303

Tony,

Look at http://www.demarctech.com/products/reliawave-ode/reliawave-rw-ode-main.html

This is what QHH is using for the mesh AP in the photos on my HSMM web page. It's a really good $65 kit and includes the upstream POE picker. Randy has discussed with me having a "punching party" where he brings his greenlee punches for punching out those N connector D holes. I'm going to replace my plastic boxes for this eventually, as these are much more compact.

304. Test AP in North Irving

Yahoo group: DAWG-HSMM
Date: 2004-11-23 14:51:55 UTC
From: Tom Trissell
Topic: 304 Message: 304

Due to job changes, I am moving from an apartment to the Crossland extend stay hotel at Beltline and Walnut Hill.

I would like to find out if there is a test AP in the area that I could try to work and see if I have my laptop system setup right. I figured I would try and get a room on the 3rd floor but did not know which side of the building to try for.

I am also planning on setting up my APRS station to learn more about UI-View using a TH-D7G on the laptop.

Thanks, 73 Tom KC5ILO

305. December NTMS Meeting

Yahoo group: DAWG-HSMM
Date: 2004-12-01 02:44:29 UTC
From: Bob and Debbie Kmak
Topic: 305 Message: 305

Greetings,

The December North Texas Microwave Society meeting will be held at the University of North Texas campus, on December 4th.
It will be in Room 418 of the Union Building.
Informal chat and swap meet at 12 PM. Official meeting starts at 1 PM.

The Agenda:

Election of Officers/ Club Directions for 2005

Antenna Aiming Issues for Microwave Rovers, by Wes Atchison, WA5TKU

Slots and Other 2.4 GHz Antennas, by Kent Britain, WA5VJB

A $20 Wifi Spectrum Analyzer, by Bob Kmak, K5WO

Please join us for this important and interesting meeting.

Directions to UNT:
From Dallas:

North on I-35E to Denton

Exit North Texas Blvd, turn right at light

Travel two blocks, turn right on Eagle Drive

Travel approx. ½ mile, turn left on Welsh St.

Travel three blocks, turn left on W Prairie St. (one way street)

Take first left into parking lot

W Prairie St., Avenue A and W Chestnut St form a square

The Union Building is on Avenue A.

Meeting in Room 418 of the Union Building, on the fourth floor.

From Ft. Worth:

North on I-35W to Denton

Exit W. Airport Rd (FM1515), S. Bonnie Brae, not sure how exit is marked

Turn right and proceed to the I-35E service road, turn right (towards Dallas)

Travel to North Texas Blvd, turn left, crossing over I-35E

Travel two blocks, turn right on Eagle Drive

Travel approx. ½ mile, turn left on Welsh St.

Travel three blocks, turn left on W Prairie St. (one way street)

Take first left into parking lot

W Prairie St., Avenue A and W Chestnut St form a square

The Union Building is on Avenue A.

Meeting in Room 418 of the Union Building, on the fourth floor.

See you there!

Bob, K5WO

306. Hi Power Bridge/Access Point

Yahoo group: DAWG-HSMM
Date: 2004-12-03 21:09:44 UTC
From: Douglas Kilgore
Topic: 306 Message: 306

Santa Claus visited me.

From a WISP here in Dallas, I bought two of the Engenius NL2611 CB3+Deluxe Long Range Multi-Clent Bridges. These units can be either a bridge or access point. They have 200mw (23dbm) output and 3dbm greater sensitivity than many access point. They operate with 12 volts and Power-over-Ethernet.

http://www.engeniustech.com/datacom/

Here's an interesting page on hacking a unit. (Senao and Engenius are the same).
http://www.guerrilla.net/reference/80211_mod/Senao_AP3_CB3/

I decided to go with the 802.11b units instead of the G because any network incorporationg a B will automatically stay at the B speed. And that has longer range.

I also purchased a 14dbi Pacific Wireless Rootenna in which to mount one of the Engenius boxes.

http://www.pacwireless.com/products/RT24-14.shtml

Now I'm going to have fun.

From: Douglas Kilgore
Topic: 307 Message: 308

I recently purchased two Senao/Engenius High Power MultiClient Bridges and an antenna from a local WISP. This company is using the Senao and Linksys WRT54G to form a LocustWorld mesh net to provide wireless internet to the North Dallas Richardson area. (www.locustworld.com) He is very much interested in working with ham radio operators that have tall towers to expand his area of coverage. He is willing to sell equipment to hams at very low markup to increase his purchasing volume.

He is also working in the Paris, TX area for the mesh network.

He has a PowerPoint presentation available but I suspect that it is more of a sales tool rather that a technical presentation. I sure he would be interested in making a presentation to the group,. Maybe we could work that in.

In the meantime, I would be willing to work with my Senao equpment to work on the mesh net with WRT54G.

FWIW, I was in OfficeMax Wednesday night, up in McKinney. While I don't know if it's a great price but they were selling the WRT54G -- the older ones, not the latest SuperSpeed version (or whatever LinkSys is calling it) -- for $79 w/ a $20 rebate. Either way, that's not bad for a little Linux box.

I may pick one up going into work tomorrow. I'll be glad to help out, at least supply my WRT54G's but I won't be much good 'til after New Year's Day.

I have my son and granddaughter visiting from Denver. Also I am working the White Rock Marathon Sunday and probably won't be done there until 4:00pm.

I guess that wipes out the weekend.

Then there's the RWK dinner Monday.

After that my time is flexible.

313. Looking for Wifi Connectors

Yahoo group: DAWG-HSMM
Date: 2004-12-14 12:22:39 UTC
From: Bob and Debbie Kmak
Topic: 313 Message: 313

All:

The January NTMS meeting will include a mini workshop devoted to measuring the signal loss of WiFi jumpers and pigtails. To that end I've been gathering the usual reverse polarity adapters, but have been unable to find a source for a MC Card **jack** and a reverse polarity MMCX **jack** . If anyone knows of a source for these connectors, please let me know. Or if your have a dead Wifi device that has one of these connectors, and wouldn't mind sacrificing it to the cause, please contact me.

73,

Bob Kmak K5WO

315. 05 Hamcom HSMM Programming

Yahoo group: DAWG-HSMM
Date: 2004-12-14 16:47:14 UTC
From: J. Beadles
Topic: 315 Message: 315

All,

Hamcom is the north Texas regional hamfest held in the Arlington, TX convention center. This year, Hamcom will be a three day event running June 3, 4 and 5.

At Hamcom last year I coordinated a set of APRS and HSMM presentations. This year I've been tapped to be Hamcom's programming director, which just goes to show that no good deed goes unpunished.

So, naturally, I'm looking for programs! I've been asked to have a preliminary list of programs by the end of this month so that they can be published on the Hamcom web site. Naturally we'll retain all of the usual events, association meetings and presentations; however, it is my intent to specifically focus on training in various topics, sort of a "Hamcom University".

In the past year, I'm seeing some of TX county organizations starting to adopt Winlink 2000 over VHF Packet using Telpac. What I would like to do is to develop some additional training that discusses how to integrate APRS, Winlink over VHF packet and HSMM into a cohesive system. In addition, I'd like to keep our existing APRS and HSMM training.

We certainly have time to put this together, but if you think you might be interested in helping with this effort, please shoot me an email to n5oom@....

318. January North Texas Microwave Society Meeting in Richardson

Yahoo group: DAWG-HSMM
Date: 2004-12-20 20:44:19 UTC
From: Bob and Debbie Kmak
Topic: 318 Message: 318

Guys,

Do you know how much of your 802.11 signal is being lost in your coax jumpers? The January NTMS meeting will feature a workshop by Kent Britain, WA5VJB, for testing the loss of any WiFi jumpers or pigtails people bring in. He will have adapters for the following connectors:

Reverse polarity SMA plug
Reverse polarity SMA jack
Reverse polarity TNC plug
Reverse polarity TNC jack
MMCX plug

The meeting will be on Saturday, January 8th at the St. Barnabas Presbyterian Church, on the NE corner of Mimosa and Belt Line Road, in Richardson.
Time is 12 PM to 5 PM, although the cable testing workshop is only inteneded to last for the frst hour or two.

In addition, there will be another mini-workshop for measuring transmitter output of VHF/UHF & up radios, and checking the calibration of VHF/UHF wattmeters. Al Ward, W5LUA, will be running the tests with accurate power meters and a spectrum analyzer.

Presentations:

"Using the Linksys WRT54G Wireless Router" by John Beadles, N5OOM
"Using APRS to Track Microwave Rovers", by Bob Kmak, K5WO

Meeting time: 12 PM to 5 PM (cable and transmitter testing from 12 PM to 2 PM)
Saturday January 8th, 2005

Location: St. Barnabas Presbyterian Church
1220 W. Belt Line Rd.
(NE corner of Mimosa and Belt Line)
Richardson, TX

Entrance to meeting hall is from the parking lot on the north side of the building.

Come join us for a fun time and bring your rig, wattmeter, or WiFi jumpers and pigtails for testing!

NTMS website: www.ntms.org

For more info or questions contact Bob Kmak, K5WO k5wo at arrl.net

Let's look into early January since I'll be busy through Christmas at
least. I talked to Randy, and while he's been busy collecting info
on network management utilities, he's also going to have to stand for
reelection for Garland city council, so his time will be limited.

Me too. I suspect this will be an early January thing, weather
dependent. I am going to have to do something before that NTMS
meeting since I'm supposed to present.

321. More WRT-54G stuff

Yahoo group: DAWG-HSMM

From: J. Beadles
Topic: 321 Message: 321

Looking at the store prices, WRT-54Gs seem to be going for about $49 everywhere, after rebate. However, they are $49 straight up in the blister pack at Sams club.

Reading back on the NTMS meeting announcement, this would have to be
a really, really early Jan thing, since the meeting is on the 8th.
So, I'll probably be working on this from now until then.

323. NTMS January Meeting Reminder

Yahoo group: DAWG-HSMM
Date: 2005-01-04 16:29:35 UTC
From: bdkmak@comcast.net
Topic: 323 Message: 323

North Texas Microwave Society Meeting
January 8, 2005
12 PM to 5 PM
Saint Barnabas Presbyterian Church Meeting Hall
1220 W. Belt Line Road (NE corner of Mimosa and Belt Line Rd)
Richardson, TX

Access to the meeting hall is from the parking lot on the north side of the building.
Please join us for the first NTMS meeting of the new year.

Program highlights:

Mini workshop for measuring the power output of VHF/UHF radios, as well as
checking the calibration of commonly available VHF/UHF wattmeters.
Al Ward, W5LUA, will be conducting, using power meters and a spectrum analyzer.

Mini workshop for measuring the loss of WiFi jumpers and pigtails.
Kent Britain, WA5VJB, will be conducting.

'Using the Linksys WRT54G Wireless Router', by John Beadles, N5OOM
'Tracking Microwave Rovers with APRS', by Bob Kmak, K5WO
If time permits, we'll take a look at WiFi signals with a 'real' spectrum analyzer.

So bring your VHF/UHF/1296 radios, wattmeters, and WiFi jumpers, and join us for a fun
event!

73,
Bob Kmak K5WO
NTMS Vice President

Hi Bob,

I won't be able to make the meeting, but I would like to know the procedure used to make the measurements that Al Ward W5LUA and Kent Britain WA5VJB will use to do their testing. I have a HP 8569B Spectrum analyzer that is good from 10mhz to 40ghz. I was wondering how I could use this equipment to do some tests on different microwave bands. I was wondering if I could prevail upon someone with NTMS in writing something about practical testing of this equipment using Spectrum analyzer. Is there some info about this on the web?

Thanks in advance, 73' John Hamilton kd5inm

From: onyx665
Topic: 325 Message: 325

I don't have any measurements, only ancedotes.
I'll bring it to the meeting if you want to put
it on the analyzer.

I am currently connected to my local coffe shop.
That was never possible before at this distance.

According to the manual:
Works with B or G
RX gain +12db
TX gain +20db (Switch select 100-200-500mW)

I have no idea if TX gain is under AGC control or not?
Does G spec imply filters with flatter phase delay?

Its mounted on a VERY heavy metal base for its size.
Its either a masive heatsink or some kind of cavity.
I've had the lid off to see inside, but did not try
to separate the PCB from the metal backing plate.

The device sticker sais "see manual for FCC certification"
The manual states that it complies with exposure limits,
but does not clearly say if it is really Part15 compliant.

Cheap... MicroCenter $65 walking out the door price!
CompUSA and Frys also have em, but they want $99.
Also discovered an additional $20 mail in ripoff.
(begins Jan 1, 2005 - expires march 6, 2005)

http://www.microcenter.com/single_product_results.phtml?
product_id=0180166

Then click "popup rebate" and print.

Also worth noting:

Output connector: WiFi RP-SMA male
Local connector: Standard SMA female
2ft WiFi RP-SMA female to Standard SMA male cable.
Generic 2dbi WiFi RP-SMA female ducky.
Wifi RP-TNC female to Wifi RP-SMA male adaptor.
(one piece adaptor, not a jumper or pigtail)

Comes with 12VDC Regulated Switching WallWart.
Does not appear to have any local regulation
inside the amplifier device. I don't know if
its safe to run on 14VDC cigarette power?

John,

Just back from vacation. Sorry you won't be able to make the meeting.

Great on having a HP8569B. I have never used one but have heard it mentioned enough to know that it's a popular spectrum analyzer. Many spectrum analyzers will allow you to read power levels directly from the screen, although you have to be careful about overloading the input circuits. The HP 141T that I use, for instance, has a maximum input limit of 10 mW, or 10dBm.

The spectrum analyzer that Al Ward is bringing to the NTMS meeting has a maximum input power limit of 1 watt, or 30 dBm. By connecting power attenuators in series with the analyzer (between the rig under test and the SA) he should be able to directly measure power up to 50 watts or so. He will also be bringing a set of wattmeters from his station.

The other way to measure higher power levels with low-power test equipment is to use a directional coupler. The coupler goes between the signal source (like a transmitter or oscillator) and a dummy load. One of the sample ports on the coupler will produce a sample signal that is 20 or 30 dB down from signal source.

So for instance, if you are using a coupler with -30 dB directivity, and you are testing the output of a 5 watt handie-talkie, the signal at the forward direction sample port will be .005 watts, or 5 mW, well within the input restrictions of almost any spectrum analyzer. Check the documentation for your 8569B before risking damage to it!

Measuring cable loss requires a low power signal source at the desired frequency and an accurate means of measuring power.
The basic technique is:
A. Connect signal source directly to power meter or spectrum analyzer and record power level.
B. Insert cable to be tested between signal source and power meter and measure decrease in power level.
C. The difference between the power levels is the cable loss; that is, the amount of the source signal that is being used to warm up the cable :-)

Don't hesitate to contact me if you have any other questions or if anything I've said is unclear. I encourage you to attend future NTMS meetings; guys like Al Ward and Kent Britain know WAY more about all this stuff than I do, and would be happy to answer your questions.

Another thing I would suggest is to subscribe to the WA1MBA microwave reflector. A lot of the guys on that reflector use the 8569B and would be able to provide much more specific info on it's use. To subscribe, go to http://www.wa1mba.org/reflect.htm .

73, Bob K5WO

328. NTMS meeting - wrt54 demo

Yahoo group: DAWG-HSMM
Date: 2005-01-07 05:33:51 UTC
From: J. Beadles
Topic: 328 Message: 328

Well, it's not going to be much of a formal presentation, but I have been able to get two hops of bridged 802.11b on three WRTs working with a camera at one end. WDS in LAN mode works, apparently.

329. KD5ZXG: Testing HSB1at NTMS

Yahoo group: DAWG-HSMM
Date: 2005-01-09 21:20:06 UTC
From: onyx665
Topic: 329 Message: 329

We discovered today there is an important difference between the white retail box and the silver retail box. The older White box has NO FCC Part15 certification, and it comes with a reverse TNC adaptor to use with Linksys and others.

The newer Silver box comes with a statement that the booster is now FCC Part15 certified with one specific Hawking router. I don't recall the model number of that router. The reverse TNC adaptor is MISSING!!! An empty cutout in the packing foam where it used to be is still present, and a perfect fit for the missing piece.

There is no difference in the FCC sticker on the devices. Both versions simply say "refer to manual". The older manual then sais nothing except that outside a 1ft radius of the included antenna it complies with FCC limits for uncontrolled exposure. That might be OK for licenced Ham use, but no go for Part15.

I think this might be the new Silver box manual?
http://www.hawkingtech.com/images/manual/HSB1%20Manual%2011-30-04.pdf

If you visit the MicroCenter link I gave earlier, there is no way of knowing which version they might ship? I would suggest hitting the shelves in person before all the old white boxes are gone. If you care about obtaining an RP-TNC-F to RP-SMA-M adaptor.

Kent Britain tested the recieve gain and cable losses of my HSB1. The RX gain measured +8.4db @ 2450mhz , the cable loss was -0.4db. Thats -4db less gain than the +12db RX spec given in the manual. I didn't think to ask about the noise figure.

TX gain and power was not tested. Kent's meter was too sensitive. The equipent to do the testing was present, but would have meant tearing down two of the workshops to make it happen. Perhaps next time? I am still interested to know if the 100/200/500 switch is simply by attenuation or true AGC?

I have experimented adding bead chokes on the outside of my coax (between HSB1 and my +16dbi horn) to see if they might be helpful? And confirmed they don't make any difference with my application. The RFI chokes I tried were of type #43 material.

I also paid my club dues, and am no longer just a freeloader.

330. Hawking HSB-1 500mw Signal Booster at Fry's

Yahoo group: DAWG-HSMM
Date: 2005-01-11 22:17:36 UTC
From: Douglas Kilgore
Topic: 330 Message: 330

This is Tuesday afternoon. I just returned from Fry's in Plano and they had a few of the Hawking HSB-1 2.4Ghz 500mw Signal Booster in the white box. These did contain the RP-TNC to RP-SMA adapter. Their price marked on the shelf was $99 - 20 Mail-in rebate = $79. When I showed them the ad from Micro Center selling for $69 - 5 instant rebate - 20 mail-in rebate = $44, Fry's matched the price.

There we a few of the white boxes left on the Fry's shelf. Be sure to read the side panel to see if it contains the RP-TNC to RP-SMA adapter if you need it.

I returned the unit to Micro Center that I purchased last week.

Subject : Re: DWL900AP+ Firmware and Hacks

Hello Ken,

the firmware I made fixes antenna selection. Actaully with official firmwares it doesn't always transmit from the internal antenna. It switches to the opposite antenna from RX to TX. This is not for all firmwares. Some firmwares (like 3.02) work differently.We have seen that above 18dbm (with hardware hack) the distortion is unacceptable. I dont know on which level it has the lowest distortion but I guess that it improves even more under 18dbm.

>KenPeter@...
>KD5ZXG (Technician Class)

I copy this here, mostly because someone at the meeting asked about separating the input from the output. Seems that might actaully have been the original default behavior for my device.

In my case (bi-directional amp + 1 antenna) I was needing both to appear at the same port and didn't want to hack out the PIN diode switch, the points I have to solder are incredibly small.

332. WRT-54G Test Results

Topic: 332 Message: 332

Linksys WRT-54G Test Results □ January 8, 2005□01□11

INTRODUCTION

As a result of having to give a presentation to the recent NTMS meeting, I had occasion to do some more extensive WRT-54G testing. The Linksys WRT-54G is perhaps one of the more popular 802.11b units due to the ability to easily hack the firmware of the unit to provide additional features. This is due to the fact that it uses a Linux based firmware that some enterprising individual managed to find a way to load into the box.

A number of 3rd party firmwares are now available that serve various purposes. Possibly the most popular firmware is produced by Sveasoft (www.sveasoft.com). Sveasoft provides release firmware for free, and prerelease and support for a $20 subscription. The current release firmware is called "Satori". Satori provides software power modification up to 83mw. The current pre-release firmware is called "Alchemy", and is reported to provide power modification up to 250mw.

Satori and Alchemy both provide access to WDS (Wireless Distribution System) bridging and repeating features. WDS bridging occurs on a MAC level, though different settings provide different IP based routing features. I haven't found any documentation on these settings, so we'll use the easiest setting.

TEST CONDITIONS

I used 4 v2.0 WRT-54G units, all loaded with the most recent Sveasoft Satori release. While the system would work with all units having the same SSID (so that the client could roam seamlessly) all units had unique SSIDs for ease of testing. The units were configured as follows:

(SSID) N5OOM-2AP - 192.168.1.2
(SSID) N5OOM-3AP - 192.168.1.3
(SSID) N5OOM-4AP - 192.168.1.4
(SSID) N5OOM-5AP - 192.168.1.5

In addition, a D-link internet web camera was programmed for 192.168.1.30 and connected to N5OOM-5AP with an Ethernet cable.

The test client was a laptop running Windows 2000 with an Orinoco 802.11b card and standard Orinoco client software.

Transmit power on each AP was turned down to about 15mw. Units were separated by no more than 30 feet.

TEST 1 RESULTS

1. All units were programmed to operate on ch 1
2. All units WDS settings were set to type "LAN"
3. The units WDS pages programmed with the adjacent units MAC addresses as follows:

N5OOM-2AP <-> N5OOM-3AP <-> N5OOM-4AP <-> N5OOM-5AP= Camera

The client was wirelessly connected to each AP in turn. While connected to each AP, the client was able to ping all APs with no packet loss. The client was able to connect to and stream video from the web cam.

An additional test was performed at the NTMS meeting, with Doug KD5OUG connecting a Senao access point connected to N5OOM-5AP with a straight Ethernet cable plugged into one of the lan ports on N5OOM-5AP. The Senao AP was configured for ch 6. KD5OUG connected his laptop to the Senao access point and established a Netmeeting session to N5OOM's client connected to N5OOM-2AP. This demonstrated a system with 5 wireless hops.

TEST 2 RESULTS

An additional test was performed due to the results of the 2004 Wild Ride where we attempted to connect 3 bridged hops at a common switch. The system using Linksys WAP-11s failed because the system only allowed one WAP-11 bridge to run at a time when connected to the Ethernet switch.

In this test:

1. N5OOM-2AP and N5OOM-3AP were set to operate on ch 1.
2. N5OOM-4AP and N5OOM-5AP were set to operate on ch 6.
3. N5OOM-3AP and N5OOM-4AP were connected via a straight Ethernet cable plugged into the lan ports of each unit.
4. All units WDS settings were set to type "LAN"
5. The units WDS pages programmed with the adjacent units MAC addresses as follows:

N5OOM-2AP <-> N5OOM-3AP
N5OOM-4AP <-> N5OOM-5AP= Camera

The client was wirelessly connected to each AP in turn. While connected to each AP, the client was able to ping all APs with no packet loss. The client was able to connect to and stream video from the web cam.

NOTES

1. Some users have reported burning up units from raising the xmit power. However, the Sveasoft programmers report running units at full power with no problem. It may be possible to add a heat sink to the RF section; however, the RF section is shielded. The heat sink may be connected to the shield or the shield may be penetrated, though this would need to be tested.

2. The WRT-54G units use a linux firmware, but no free disk space exists in the unit. Any new software needs to be written into the firmware. It will be interesting to see if future firmware includes an NFS feature, allowing connections to external disk space, or a networked USB memory stick.

3. A hack exists to attach up to 2 serial ports to later WRT-54G models. It would be interesting to use this to control radios, or act as an internet gateway for an APRS digipeater.

333. Cheap or free network management software

Yahoo group: DAWG-HSMM

From: J. Beadles
Topic: 333 Message: 333

ZDNet has a free daily email that often includes pointers to some nifty software. Here are a couple of network management packages that look like they'd be useful to us.

PRTG Traffic Grapher (free)
http://www.download.com/PRTG-Traffic-Grapher/3000-2648_4-10344479.html?tag=sptlt&tag=nl.e539

Lantern Manager ($29)
http://www.download.com/Lantern-Manager/3000-2651_4-10352022.html?tag=sptlt&tag=nl.e539

334. KD5ZXG: Anaren 2.4ghz 90 degree hybrid couplers (SMT)

Yahoo group: DAWG-HSMM
Date: 2005-01-13 18:05:04 UTC
From: Ken Peter
Topic: 334 Message: 334

I got 1 strip of 10 hybrid couplers from ebay (surface mount type)
I don't actually need that many. I can spare a few (perhaps 4?).
Free give away to the best suggested use for them. They don't
all have to go to the same place.

They might be good for circular polarization feeds? Splitting and
summing power amps. The guy who sold them to me claimed
they are good up to 60W.

The model is Anaren Xinger 1A1306-3, if anyone can confirm or
deny the specs on this part would have my thanks.

KD5ZXG
kenpeter@...

335. KD5ZXG: found spec sheet.

http://www.anaren.com/products/product_detail.cfm?prod=18

Again, I can spare up to 4 couplers to anyone locally
who might have an interesting suggested use for them.

336. N5OOM's spring testing direction

Yahoo group: DAWG-HSMM
Date: 2005-01-17 20:15:42 UTC
From: J. Beadles
Topic: 336 Message: 336

I thought I'd take a moment to throw out the direction I'm intending to go for equipment testing this spring. Most of my primary thought will be given to packaging the WRT-54Gs based on the results of the testing that I posted earlier.

1. I am intending to package two WRT-54Gs in Steel Dmarc Tech boxes similar to KC5QHHs units. I have obtained two of the hawking power amplifiers and two mini-circuits splitters from a vendor at Wintercom this last weekend. It is my intent to package these such that they can operate as a WDS bridge with two antennas in different directions but be flexible enough to use as local access points.

2. The other two I want to package in the Rootenna boxes with the integral 19db panel antennas. These would be used as fixed bridge radios for events.

3. In addition, I'm intending to pick up one or two more for hardware experimentation. I'd like to add on the serial port extension and connect them to TNCs. I'm thinking this might be a way to make a cheap standalone APRS Igate or Telpac gateway.

All of these units will use the Sveasoft firmware. I'll upgrade to the Alchemy firmware as soon as it is released. The goal is to have access to the 250mw power adjustment that I've been seeing available.

4. I have more research to do on the WDS bridging. The Sveasoft Satori release

5. As soon as I get some of these things packaged up, I need to go out to the Balloon Festival park in Plano and test out the WDS bridging across actual distances.

6. We discussed last year setting up a contest. To that end, I need to pursue getting a high-gain slotted waveguide antenna made.

Oops, have to go. More later.

337. Wild Ride 2005 on May 21, 2005

Yahoo group: DAWG-HSMM

I just attended the first planning meeting for the Richardson Medical Center Wild Ride 2005 bike rally. It will be held on Saturday, May 21, 2005 in conjuction with the City of Richardson's WildFlower Festival.

The routes have not been finalized at this time but the start line will again be near the MCI building.

I hope this year we will be sucessful in placing a webcam at each reststop uploading realtime pictures to the internet.

We'll need lots of help so mark you calendars now.

Doug Kilgore KD5OUG

338. WRT54G, serial ports and TNCs

Yahoo group: DAWG-HSMM
Date: 2005-01-23 15:43:38 UTC
From: J. Beadles
Topic: 338 Message: 338

One nifty feature of the WRT54G v2 and later is that the circuit board has solder pads for an 8 pin header strip that allow for 2 serial connections. The output is raw TTL, so you have to add an RS232 level converter board with appropriate connectors to actually get RS232 out. This has been done, and persons have been able to establish serial console connections with the WRT54G.

It occurs to me that this feature has more uses for us than perhaps for the average user. By connecting a TNC to the WRT54G, we might get a standalone box usable as an APRS digipeater / internet gateway or a telpac node for use with local Winlink systems. Thus, we can put a TNC where it is best placed for VHF / UHF work, and bridge a remote internet connection to the TNC using the RF portion of the WRT-54G.

The problem for this is developing code that can run the TNC. The SVEASOFT firmware for the WRT54G does provide the ability into the box, and from there you can use the serial port to connect to the TNC. However, for things like telpac nodes, I assume there would need to be some code running on the WRT54G to gate traffic to the internet. Problem is that the firmware update does not provide useable disk space that we could use to load custom programs as we would ordinarily do. What has to happen is that some enterprising ham with the technical ability to do so would need to write the control code into the WRT-54G firmware.

We need this done anyway. If we use WRT54Gs for ham use, it'd be awfully convenient to have somebody code an ID method into the firmware. If somebody can suggest one, I'll suggest it to the guys at SVEASOFT and see if they are amenable to adding it to the next release.

Directions for the modification are here:

http://www.rwhitby.net/wrt54gs/serial.html

The mod uses a 3rd party AD233BK 233A CTS RTS adapter kit, roughly $20 from Compsys, at:

http://www.compsys1.com/workbench/On_top_of_the_Bench/Max233_Adapter/max233_adapter.html

So - if the WRT54G could be a cheap TNC controller, where do we get a cheap TNC? The TNC-X is a $45 KISS only (but expandable) TNC kit developed by John Hansen W2FS.

http://www.coastalchipworks.com/PICTNC.htm.

340. (Fwd) [Ham-80211] Aerocomm Modems

Yahoo group: DAWG-HSMM
Date: 2005-01-24 03:03:00 UTC
From: jbeadles@pobox.com
Topic: 340 Message: 340

This off the TAPR 802.11 list...

------- Forwarded message follows -------
From: "Steve Lampereur" <kb9mwr@...>
To: <ham-80211@...>
bscribe>

I saw these in the RF Design magazine. Something a few of us in Green Bay
are seriosuly considering playing with.

Quick summary : 1 watt 900 MHS FHSS, 115.2 kbps $99

The URL for the home page is http://www.aerocomm.com
The complete URL for the pdf spec sheet is:

http://www.aerocomm.com/Docs/Datasheet_ConnexLink.pdf

It appears that we could set up a DHCP sever and handle this like an
ISP. That would be truly cool, make it a TCP/IP network.

341. Access Piont Testing

Yahoo group: DAWG-HSMM
Date: 2005-01-24 03:09:49 UTC
From: Anthony Campbell
Topic: 341 Message: 341

I wanted to give everyone a summary of some testing that I have been doing with various access points and PC client cards. Using Netstumber as an indicator of signal-to-noise (SN) ratio, I ran testing comparing various combinations of these devices. All of this testing was done inside of my pretty typical house over a distance of about 30 ft. Due to the addition of external antennas, some of the configurations would not qualify as Part 15. This included going thru several walls. I tested the following devices:

Access Points
Linksys WAP11 with stock antennas
Linksys WAP11 with external 5 dBi omni antenna via a short jumper
Seneo 2611CB3Plus with stock antenna
Seneo 2611CB3Plus with external 5 dBi omni antenna via a short jumper

PC Client Cards
Orinoco 802.11b
Seneo 2511CBPlus with external 5 dBi omni antenna

Testing
Access Points
Both the WAP11 and 2611 are 802.11b access points. The primary difference being that the 2611 has a rated output of 23 dBm while the WAP11 has a rated output of 15 dBm. The testing showed an average of 11 dB improvement between the two access points. That seems a little higher that projected, but in the reasonable considering the measurement technique. When I repeated the tests but with higher gain antenna, I got an additional 4 dB improvement by using the external 5 dBi antenna.

PC Client Cards
Although the Seneo card that I was using has a higher output power, I did not test this. Using Netstumbler, I was only testing receive SN. The primary difference in the two cards tested is that the Orinoco was utilizing an internal antenna and the Seneo was using an external 5 dBi omni antenna. The test results showed that the Seneo had an average improvement of 7 dB. This is a reasonable result.

Summary
I am sure that is will come as no surprise that in many cases higher power and better antennas are a good thing. I was able to demonstrate a 22 dB improvement in SN from a typical stock system to one that using higher power and better antennas.

I will continue to do further testing. When I receive a WRT54G, I will see how it stacks up against these devices in both stock and modified configuration.

In addition to the difference in output power, the senao/engenius and SMC high power units have a 3 dbm greater sensitivity. That accounts for the improvement.

343. More WRT54G testing

Yahoo group: DAWG-HSMM
Date: 2005-01-24 06:50:30 UTC
From: J. Beadles
Topic: 343 Message: 343

Whilst thinking about how to invest this paycheck's discretionary cash (do I put my existing units in outdoor cases or what), I found myself at the Sam's club in Addison at Midway and Beltline, looking at some more of the $49 Whttp://groups.yahoo.com/group/ntms-hsmm/postRT54Gs and decided that the best thing I could do right now was to continue to test some more complex bridged network topologies. So now I have a total of 6 WRT54Gs, all with Sveasoft Satori firmware.

The Sveasoft firmware documentation is listed at:
http://docs.sveasoft.com/SV-Guide.html

Also, a set of pics of the WRT54G spectral output at different power settings is available at:
http://explorer.cyberstreet.com/wrt54g/WRT54g-spectraloutput.html

By comparison, the WAP11 spectral output is at:
http://explorer.cyberstreet.com/wap11/WAP11_Spectral_Output.html

AP configurations:

N500M-2AP - 192.168.1.2
N500M-3AP - 192.168.1.3
N500M-4AP - 192.168.1.4
N500M-5AP - 192.168.1.5
N500M-6AP - 192.168.1.6
N500M-7AP - 192.168.1.7

All units tested within 80 feet of each other, though I did spread them around the house to complicate the RF picture a bit.

All of the units were locked into 802.11b mode.

FIRST TEST:

The first test was to bridge all for units in a line so that each AP was bridged to the two on either side of it (except the endpoints). I used my client card to connect to each AP in turn. As I connected to each AP, I pinged the all of the APs using a freeware IP scanning tool called "Angry IP". I was able to ping all units on the chain no matter where I was connected. No particular packet loss was observed. The test is considered successful.

SECOND TEST:

The second test was to try the configuration we had such problems with at the Wild Ride event last year. There we attempted to put three Linksys WAP11 access points on the roof of the Nortel Tower, with each bridged to a different access point on a different

frequency. This would form a "T" configuration.

In this test, APs N500M-5AP, N500M-6AP and N500M-7AP were connected together with ethernet cables plugged into N500M-6AP.

N500M-2AP was bridged to N500M-5AP on ch 1.
N500M-3AP was bridged to N500M-6AP on ch 6.
N500M-4AP was bridged to N500M-7AP on ch 11 (in part 15 mode).

The laptop client was used to connect to each AP in turn. As I connected to each AP, I pinged the all of the APs using a freeware IP scanning tool called "Angry IP". I was able to ping all units on the chain no matter where I was connected. No particular packet loss was observed. The test is considered successful.

SCANNING WITH THE WRT54G

The Sveasoft firmware provides a telnet interface which is enabled through the administration page on the web interface. To login to the box, use "root" as the user id and the admin password. The "wl" command, which has about 150 subcommands, is used to control various aspects of the radio interface.

One of the things you can do is put it into a scanning mode where it will scan and report any APs it hears. To do this, a series of 3 commands is used:

```
wl ap 0
wl scan
wl scanresults
```

This takes the unit out of access point mode to allow it to scan. To put it back in ap mode, use:

```
wl ap 1
```

Doing this on one of my units produced the following result:

```
(none):[~]# wl ap 0
(none):[~]# wl scan
(none):[~]# wl scanresults
SSID: "N500M-5AP"
Mode: Managed RSSI: -60 dBm noise: -91 dBm Channel: 1

I have 4 12V 7AH gel cel batteries. They are older batteries but they should have enough life left for 2-3 hours of testing.

I planned to make them RACES standardized with the Anderson PowerPole connectors. I will make adapters to go from RACES connection to coaxial plugs to fit the WRT54G.

I guess we should plan to use Power-over-Ethernet. That means I need to also make 4 coaxial to coaxial jumpers to work at the top end.

Good! While I do have some of those APs hard cased, I'm probably going to slap something together for the others for testing. I'm likely to make some cheap powerpole extension cords rather than do much more POE stuff just now. This is all getting expensive.

So, what is the power input of the WRT54G? 5 or 12
VDC? Also, have you measured the power requirements.

The v2s and I think the v1.1s are 12v. The v1s are 5v. We do need
to measure power input to it and test out that DC to DC converter in
the box.

352. DC-DC converters by VICOR - Work well for PoE WiFi Applications.

Yahoo group: DAWG-HSMM
Date: 2005-01-25 16:05:17 UTC
From: Randall Dunning
Topic: 352 Message: 352

Hello,

I have successfully used VICOR converters successfully to convert DC voltages in my WiFi equipment. Personally, I prefer 24V or 48V for PoE applications since you can send more power over dinky little wires at the higher voltages. I also have some of the 36V VICOR converters because they work from 22V all the way to 40V which is great for 24 volt applications (a good 24 volt system runs from 22.5 to 27 volts. In addition, most people don't realize the 36V converters can be used at 24 so they suffer from low demand and sport a proportionally low price. I have bought 36V -> 5V and 36V -> 12V converters for as little as $5 US a pop! You can take gel cells and make 24 or 48 volt systems that will exhibit less voltage drop over those teenie-weenie CAT5e wires.

12V to 5V converter:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4660&item=3869749678&rd=1&ssPageName=WDVW

24V to 5V Converter (I might buy this one as I live in a 24V world):
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4660&item=3869749602&rd=1&ssPageName=WDVW#ebayphotohosting

Personally I"ve been sending up 117 VAC up #16-22 wire up towers, on roofs, etc. with no problem and using small117 VAC powersupplies and wallwarts to get the desired voltage/power level(s) needed.

354. Re: DC-DC converters by VICOR - Work well for PoE WiFi Applications.

Yahoo group: DAWG-HSMM
Date: 2005-01-25 17:39:19 UTC
From: J. Beadles
Topic: 352 Message: 354

We've certainly done that, running 12ga cable 120ft up the tower for the Wild Ride last year. From a field deployment standpoint, POE is awfully convenient, though. We are working on doing field deployments at these public service events, and frankly, carrying around all these boxes of stuff gets old after a while. So I'm up for shrinking down my eqpt as much as possible, and using POE achieves that.

Now for the next step... I'd like to build a standard POE kit that would maybe let you take two gel-cells, wire them to the injector for 24v upstream, and then pick off as many different regulated voltages at the top as I wanted, thus letting me power multiple bridge radios, switches, cameras, etc.

I did a bit of research on the DC-DC converter chip that is used in the WRT-54G, and the specs say that it will accept an input voltage up to 45v. It is really a very simple circuit. What I'd like to do is to have a custom PCB cut that has the two RJ-45 connectors and a space to build that DC-DC converter, customizable for whatever voltage I wanted. Also, I'd include the ability to let the power pass through the next jack if desired so that I could string several of these in series, pulling off different voltages.

I talked to Kent Britain WA4VJB, who makes those PCB antennas we've all seen. He says that the PDC for the kit is very doable, and economical in quantity.

Type B Power looks easy enought.

I just don't use the Protector Chip but a 500ma Fuse
seems to do the job for me.

This is a very interesting discussion. It appears as
if the IEEE standard for POE is -48 VDC. So, to me it
seems like we should either standardize on this or on
12 VDC since that is the most common battery voltage.
I would really like to stay away from AC line voltage.
I really hate getting shocked.

Which store in Plano, Doug? There's two: one just north of Bush on Coit
Rd, and the other at Spring Creek at Central Distressway.

Since I work a mile or so way from the Sams in Addison, I picked up one
there last night. There were three left... :-)

I'll add the current status:

Sams at Spring Creek & Central - Out
Sams at Coit & 190 - Out
Sams at Beltline & Midway still had a few left.
Sams at Forest & Greenville - Unknown
Sams at NW Hwy near Frys - Unknown

If anybody finds any left at any of the othe Sams, please post where you got them. I know of at least one person who doesn't have a Sams membership so if somebody wants one at that price, I'd be willing to run and get one for them.

Incidentally, I got a report from Jonathan Senneti N5VX that he picked up at Circuit City that was a v2.2. Reviewing Sveasoft's web site, the v2.2 uses a different ethernet controller chip from the v2.0 and requires the Alchemy firmware which has not been publically released yet. You can get it, you just have to pay Sveasoft $20 for the subscription to get it.

Affirm. I think that is the pinout that Demarc Tech uses in their POE device. Incidentally, I ran across this company Microcom (store.microcom.us) that has some REALLY GOOD PRICES on POE devices and certain pigtails (like $10 to Demarc's $18), but they want a $100 min order. I'm considering doing a group purchase if anybody else wants any of them.

I think we should standardize on power at the bottom of the tower. Everyone is building different boxes and some will have power amps.

A 12 V gel cel is considered discharged at 10.5 volts. A charge is being applied, the voltage might be as high as 14.4 wolts on the battery terminals. This is the type of battery we use for radios. I think we should design our systems around that. Use an Anderson PowerPole for the 12 volt connection for RACES standardization.

The voltage drop in the Cat5 wire will depend upon current draw and length of the wire. Although Ethernet can work about 300 ft on Cat5, I think we could compromise on a standardized length of 150 ft. That would be a practical length for most installations.

For me, I'm interested in the 5/15V P-o-E Kit for $16.95.
http://store.microcom.us/picat5.html
I plan to use two devices at the top - one 12V and 5V. Combine that with a cheap off-the-shelf 12VDC to 110VAC converter and I can use a gel cel or an automobile for power.

Randy and I were talking about this standardization the other day.
Figured we ought to standardize on N connectors mounted to the
exterior of any case.

Topic: 352 Message: 366

I aggree on N. But should they be Male or Female?

I recommend Female.

Doug

Female, definitely. That causes a problem on those cases we have, doesn't it? On account of there not really being a good place to put them.

I fail to see the difficulty. What am I missing? I have put N-F chassis mount connectors in the Rain Bird controller box for my WET-11, 2 N-F chassis mount connectors in the Home Desperate sprinkler box, and two of the same in a DemarcTech small box.(BTW, I also have the wondrous little Greenlee D chassis punch that is just right for making pretty holes for N-F connectors.)

As for the different types of water-resistant RJ-45 connectors, I am using the RJ-Lynxx connectors. These appear to have the maximum versatility and are available from numerous sources. They also have the virtue of accepting a cap and have field installable cable termination kits which I have successfully used for a bout of CAT-5 building last field day. Here are the sources I have used:

http://store.yahoo.com/awc-direct/etcon.html (best prices)
http://www.bb-elec.com/product_multi_family.asp?multifamilyid=13

Amphanol has a competing product available at:
http://metrix.net/metrix/products/parts
(This is even pricier than the RJ-Lynxx connectors!)

One other benefit of these connectors is the plug housing screws onto the socket which should make a stronger field connection as well as providing water and dust resistance.

Cheers,

RD - KC5QHH

These other sprinkler cases have kind of a curved bottom and those 3
holes already punched in inconvenient places. I'll have to look and
see if they can practically be punched.

373. Hawking RP-TNC to female RP-SMA adapter

Yahoo group: DAWG-HSMM
Date: 2005-01-27 03:19:28 UTC
From: J. Beadles
Topic: 373 Message: 373

Just an fyi, if anybody runs into this problem -

I was looking at getting some of the Rootenna cases. These are basically outdoor equipment cases with either a 14db or 19db antenna built into the box. Problem is that you have to specify the connector you are going to use. While I'm using the WRTs that have RP-TNCs, I may also optionally be using the little Hawking power amp that Ken described earlier, and they come with a RP-SMA connector on them. So, I need an adapter that will go from one to the other.

If you get the right power amp, you get an adapter, but I got one that didn't. Hawking sells a teeny RP-TNC to female RP-SMA adapter, part number H-ACST as a separate part. A google search found me some for about $10.

376. Of Holes and Housings

Yahoo group: DAWG-HSMM
Date: 2005-01-27 16:38:10 UTC
From: Randall Dunning
Topic: 376 Message: 376

Set your mind at ease John, The RealTime sprinkler timer case (available from Home Desperate for $6.00 last time I looked) is not so curved that it makes adding new holes a problem. Further the three prepunched holes are near the center leaving a great deal of real estate on the bottom for custom holes (so long as you take care not to impinge on the standoffs inside). With mine, I took out the fragile little rubber grommets and used a stock cable gland for additional CAT5 cables (camera cabling, for example). Next I plugged the remaining hole(s) with caploc plugs available at any real hardware store. I frequent True Value at Arapaho & Jupiter and Handyman at Buckingham & Garland Rd. Then I used a chassis punch to cut the holes for the RJ-Lynxx wx resistant RJ45 ports. BTW, caploc plugs come in many sizes and are an excellent way to get a water resistant bug proof seal without the muss, fuss, and mess of electrical tape.

As for Doug's "holey" question, I inherited a rather extensive set of Greenlee chassis punches. I am sure there is a punch that will work with the Pac-Wireless gland. John has been agitating to have some kind of hole punch party at my expense for some time now. I can bring neat hole-making devices from 5/16" to 2.25" including a couple of different D shaped punches should such an event come to pass. And, NO, they are not for loan as they have had a tendency to go missing for extended periods of time when I have been so foolish as to let them out of my sight. That said, I would be happy to support a hole puncy party.

Cheerio,

383. KD5ZXG: Anaren Xinger 90 deg Hybrid

Yahoo group: DAWG-HSMM
Date: 2005-01-28 01:01:42 UTC
From: Ken Peter
Topic: 343 Message: 383

I ruined my first two trying unsucessfully to connectorize them. The corners don't like stress at all and break off easily. The flats are very tough and withstood rough treatment no problem.

Would have been much easier if I had a local source for sma pcb connectors, but I only had RG58 style BNC which required more than a small amount of "modification" to solder to the flats, and there were problems with my iron not being quite hot enough.

My third try appears to be a success, 3 BNC connectors and a pair of "101" (100 ohm) chip resistors at the fourth corner. That would be the isolated port... Does this discussion group allow photographs to be attatched?

I can move forward now with circular polarity experiments, or try making another and see if I can sum a pair of the Hawking boosters. I could also just sum them in free space, but I lose the output 90deg hybrid's "perfect" return loss... As the loss is wasted instead of reflected, I don't know that buys any real benefits.

I wonder how consistant the phase shift (both TX and RX) are between Hawking boosters? If they are way off, then any attempt to sum them blindly is hopeless.

Also found some circulators. The insertion loss ans isolation db's are better than most pin diode SPDT switches I see in 2.4ghz bidirectional amp schematics, They don't need any switch logic. Is it then possible to sepatarely amplify and/or attenuate the TX and RX.

385. KD5ZXG: Hawking (100mw input max) + Senao 200mw?

Yahoo group: DAWG-HSMM
Date: 2005-01-28 04:14:27 UTC
From: Ken Peter
Topic: 343 Message: 385

Hawking's HSB1 amplifier isn't expecting to see full 200mw at the input.
My 200mw tests have not caused my amp to burn up or anything yet...
I have definately been abusing it that way for quite some while now.
I don't think this is the way it is supposed to be.

I was using my SMC 200mw PCMCIA card (Prism 2.5), and i noticed an
immediate improvement when I switched to a low power (+14~18dbm)
device of another brand. D-Link's 108mbs gaming bridge (Atheros chip).
I guess this may be due to reduced TX input distortion???

Do the Senao access points allow you to reduce the output power?

I still do not know the function of the switch on the Hawking booster.
Is it smart ACG limited or merely step attentuation??? I find no similar
reliability benefit by reducing my TX power switch to a lower setting.
Where in the TX circuit is the selected agc/attenuation happening?

http://www.hawkingtech.com/images/datasheet/HSB1%20Datasheet%201220LR.pdf
I see the factory spec sheet states maximum input power at 20dbm.
That would be equal to 100mw??? But is this the optimal input power?
How does one determine the best input power for clean full strength
output? And is the optimum value different depending on the position
of the TX power select switch?

From: Joe Jurecka
Topic: 387 Message: 387

Hi all,
I've integrated an SQL database and PHP scripting on the NTMS web site.
What this means is that I can largely automate a number of tasks.

So first, on the HSMM side, please do send any upcoming events to
webmaster@... which you would like to see advertised. Provide when
you'd like to see the notice pop up (day granularity) and when the event is
along with a short description and a URL for more information.

I'm hoping to have a database of users so that, at least eventually, we can
do searches of microwave enthusiasts and find out which others have similar
interest that you do.

If you have other ideas, just let me know and I'll see what can be done.
Anything which helps members enjoy the hobby more is fair game.

73,
Joe - N5PYK
NTMS webmaster

Ken,

Darn fine research. Question, have you measured the DC current drain
from the amp? I'm thinking that for POE purposes, we probably ought
to get familiar with the actual power requirements for these things
so we will know what we can get with battery operation.

WRT54G noisy on 146.66? Figures! Why does it always have to be on the output of the Garland Repeater? The Comcast modems in the alleys are also noisy on 146.66 as are some other routers and star hubs. =8-@

I need to see now my WRT54G in the Demarc Tech NMEA aluminum box does.

Interesting. I have a version 1.0 box that does not give me a bit of trouble on Garland's rptr. Tuned the HT scanner to 146.660 and moved it near the WRT54G, even unplugged it to see if anything changed and it didn't. I'm sure there's a slew of spurs out there but I can't tell with all these computers running around the place. :-)

My wife used to have a CD-ROM drive that would wipe out TI's repeater on 145.430 three houses up and down the street. She got a new CD-ROM REAL QUICK(!) which, I'm sure, blocked out some other repeater but not the one I wanted to listen to.

>I need to see now my WRT54G in the Demarc Tech NMEA

Why would you try to pick up the Garland repeater inside an aluminum box??? :-D

Ken,

Please keep us posted on your experiments and results using circular polarity. If you have read the new HSMM portion of the 2005 Handbook (Multimedia and Spread Spectrum), you will note that it is an area in which we stressed much more R&D by hams is needed.

Thanks,
John - K8OCL

393. Serial ports on the WRT54G

Yahoo group: DAWG-HSMM
Date: 2005-01-29 06:13:37 UTC
From: J. Beadles
Topic: 393 Message: 393

Success! Using the instructions found at:

http://www.rwhitby.net/wrt54gs/serial.html

And an AD232DK dual serial port adapter from:

http://www.compsys1.com/workbench/On_top_of_the_Bench/Max233_Adapter/max233_adapter.html

I successfully got a serial connection to work on one of my WRTs.
Next goal is to hook up a TNC to it and see what happens.

If your board is of any "Cx" revision, you can put the iron away.
Firmware that corrects the antenna select bug is allready available.
And opens all hidden power and channel options too.
http://www.acinonyx.tk/
http://acinonyx.tooshort.org/

Too late for my first pair, hacked out diversity PIN diode switch
Ground pin12 of the Maxim IC (max power with bad distortion).
The recommended clean output level is no more than +17dbm.

N5OOM recently gave me a virgin DWL900-AP+, and that one
only requires flash update with the Acinonyx 3.06 firmware.

The links above no longer seem to be working. You can ask
Acinonyx himself. He reads and writes english just fine, but
you might have to translate Greek to navigate Athens wireless
forum. http://www.awmn.gr/forum/

If you want the 3.06 Acinonyx fimware, I could email it. I also
found an "official" D-Link version 3.10 fimware from one of the
non-US support site FTPs (was it Germany?). I have no idea
what may be different from the latest official US version 3.07.

After doing a little more research on this today, I have some more detail. It seems that Sveasoft's Satori firmware release removed the unix stty command which is used to set the comm port parameters. The older release included this command, and some forum messages indicate that it is possible for you to build your own version of the release that has stty included in it.

So, to access the comm ports, a serial device would need to be configured for 115200 8 n 1. On the first comm port, the WRT provides a serial console upon boot, so we get to see the entire linux boot process.

Another problem is that there is no terminal program for actually getting any data off the other serial port. These issues make connecting a TNC problematic unless we can get somebody to research building these features into the firmware.

Another option is Linksys' NSLU2 device. This is network file server device that provides a means for turning USB hard drives and memory sticks into network file services. The NSLU2 also runs a linux OS and has been the subject of substantial 3rd party firmware development. It appears that there are ways to do things like plug USB cameras & such, and the device can run a webserver that provides for PHP programming. Also, a build of Perl exists for it. This device also has a connector for a serial port that can be extended outside the case and therefore might be an option for a TNC connection.

http://www.nslu2-linux.org/

402. WRT54G development project

Yahoo group: DAWG-HSMM
Date: 2005-02-01 16:36:52 UTC
From: J. Beadles
Topic: 402 Message: 402

Do we have anybody on the list who might be willing to work on some firmware changes for the WRT54G? To do this successfully, you'd need to be able to compile linux distributions, maybe do some C coding.

Features that I can see that we would need would include:

1. Adding an APRS digipeater / internet gateway module that would use a KISS based TNC connected to one of the serial ports.

2. Adding a Telpac gateway that that would use a KISS based TNC connected to one of the serial ports. This would be particularly useable for local 2meter packet based Winlink systems.

3. Add a timer based radio power control. This is based on a thought that if we run these out in the field on battery power, it'd be good to allow the radio portion of the system automatically turned on and off when nobody is there.

4. Add an application that would allow data coming from the serial port to be streamed to a remote IP. This could be used to stream telemetry to a remote location

5. Add a weather station to APRS packet program

I now have one unit with two attached serial ports, but can't do anything with them yet. I'd be happy to lend it to whoever would be willing to take on this task.

Hi John:

Yes, I am interested. I was kicking the tires on this for a while, I
wanted to add a GPS to the device (using GPSD). What distro are you
using? So far, been playing with the SVEASOFT one, quite interested
in their up and coming Talsman release, as it is supposed to have
adaptive mesh routing in it.

Do you already have the serial adapter board made up? I haven't do
that yet, actually I haven't even compiled the build yet, just
uploaded the new SVEASOFT images and they seem to work. So any advice
here is helpful. I have a Debian (simply mepis) system setup here.

Regards,

Jeff wb8wka

Howdy! So far I've been using the Sveasoft Satori release and
looking at shelling out for the subscription to get Alchemy.
Talisman looks awfully nifty from an HSMM standpoint. My thinking is
that if we can build up the modules, maybe we can integrate a ham
specific release into Talisman. Or I could be blowing smoke. In any
case, having the ham specific features would be worthwhile.

I agree about the GPS, I was thinking it'd make a good NTP and
differential correction server but forgot to add those into my
particular mail.

I do, not of my own design, but I used the Compsys AD233DK board,
which seems to work fine. Only issue is that there are no flow
control lines.

http://www.compsys1.com/workbench/On_top_of_the_Bench/Max233_Adapter/m
ax233_adapter.html

When booted with Satori loaded, one of the serial ports is a system
console. I read through the Sveasoft forums, and another person had
to do a custom compile to add stty so that he could control the
serial port parameters. Stty apparently was in the previous release
but was dropped from Satori. I suspect that the v1.1s did not have
the serial port connector so they pulled it from the package not
thinking that serial ports would be added later. And now you know
pretty much what I know.

Doug:

Do you have a part number on that box? I'm finding orbit valve boxes in that price range, but not sure if they are fully enclosed (on homedepot.com). Have a Lowes 30 miles from me that I go by a few times a week so might stop there and see what they have.

The small orbit valve box also looked interesting to use as a radome cover over a biquad.

408. February North Texas Microwave Society Meeting

Yahoo group: DAWG-HSMM
Date: 2005-02-02 03:18:58 UTC
From: Bob and Debbie Kmak
Topic: 408 Message: 408

Greetings,

The February North Texas Microwave Society meeting will be held at the University of North Texas campus, on February 5th.
It will be in Room 418 of the Union Building.
Informal chat and swap meet at 12 PM.
Official meeting starts at 1 PM.

The Agenda:

Protecting Your Computer From Attacks, by Roger Dillon, N5PGH

Tuneup Party - 902 MHz through 10 GHz

Bring your 902 MHz and up rigs and have them checked out!
Test equipment on hand will include a spectrum analyzer, signal generator, power meter and frequency counter.
Sometimes a fresh set of eyes is all it takes to find a chronic problem.
Let's all get our rigs ready to make some noise during the April 902 and Up Rover Sprint!

Directions to UNT:
From Dallas:

North on I-35E to Denton

Exit North Texas Blvd, turn right at light

Travel two blocks, turn right on Eagle Drive

Travel approx. ½ mile, turn left on Welsh St.

Travel three blocks, turn left on W Prairie St. (one way street)

Take first left into parking lot

W Prairie St., Avenue A and W Chestnut St form a square

The Union Building is on Avenue A.

Meeting in Room 418 of the Union Building, on the fourth floor.

From Ft. Worth:

North on I-35W to Denton

Exit W. Airport Rd (FM1515), S. Bonnie Brae, not sure how exit is marked

Turn right and proceed to the I-35E service road, turn right (towards Dallas)

Travel to North Texas Blvd, turn left, crossing over I-35E

Travel two blocks, turn right on Eagle Drive

Travel approx. ½ mile, turn left on Welsh St.

Travel three blocks, turn left on W Prairie St. (one way street)

Take first left into parking lot

W Prairie St., Avenue A and W Chestnut St form a square

409. WRT54G power draw testing

Yahoo group: DAWG-HSMM
Date: 2005-02-02 05:52:48 UTC
From: J. Beadles
Topic: 409 Message: 409

I finally set up an ammeter cable and tested the DC current draw of the wrt. The results were interesting. On boot, the unit drew approx. 350mw. When it turned the radio on, the current drain went up to about 430mw. The Satori firmware provides the option of adjusting the power in 1mw steps from zero to 84mw. I selected set the unit to a range of powers from 1mw all the way to 82mw, verifying that the signal level was changing using Netstumbler. At no time did the dc current change from approx 435mw. Telnetting into the box and using the "wl radio off" command to turn the radio off, the draw dropped back down to 350mw.

Is this at 5 VDC or 12 VDC input?

Tony

12v.

Now that I've done this, I'm thinking my next step is to hook up a variable PS and see what input voltage it will take. I have a bid on a digital thermometer that I'll use to monitor the temp of the voltage regulator.

From: Ken Peter
Topic: 409 Message: 412

Don't bid too high. I allready have an IR non-contact
thermometer (with laser pointer) you can borrow for
those tests.

>From: jbeadles@...
>I have a bid on a digital thermometer that I'll use
>to monitor the temp of the voltage regulator.

I bought some 0.2db noise figure HJ Fets on ebay.
Now wondering how to match the input for lowest
noise? Ropt for noise is only specified at 4ghz, and I
have to guess based on the Smith chart of a similar
GASFET which way the match for 2.437ghz is likely
to drift. (slightly more capacitive?)

I'll be taking advantage of the Xinger hybrid couplers
I bought earlier to hide the reflection by misdirecting
it back to an isolated port. This means I'll be using 2
HJ Fets in a 90degree balanced configuration.

Why is the optimum input match for low noise not
the same as the best match for power transfer and
low reflection?

Don't the reflection losses count AGAINST the over
all noise figure (S/N ratio input) / (S/N ratio output) ?
How does wasted input power reduce output noise?
Have they (NEC) allready computed this loss into the
Ropt graph?

Is there any noise benefit to cool an LNA down only
slightly below 0C with thermoelectric coolers? Or do
you have to go a lot colder than that?

Nifty! I'll still wind up with a dedicated unit with wired probes though, because I'd like to stick the probe in a sealed case over the summer and try to do some real heat susceptability testing. There are some on eBay going for in the $20 range, so it's not too bad.

From: Ken Peter
Topic: 414 Message: 414

>Are you on the NTMS mailing list? You are elegible if you are a paid
>member. Some of these questions should be asked there.

I thought this WAS the NTMS mailing list??? I get an email every
time someone here posts...

If you were suggesting my 2.4Ghz LNA questions might not be
relevant to our hsmm discussion? What else would I be planning
to do with one?

I don't know the typical RX noise figures of our access points.
I know my HSB1 booster is claimed to be around 3.5db, and
that number is supposed to be some kind of an "improvement".
I see discreet FETs as low as 0.25 and MMICS as low as 0.7,
so why should we suffer less than the very best available?

I suspect the pin diode diversity switch in most equipment adds
to RX loss and noise as well. Your linksys booster may be the
exception? As your RX LNA goes straight to its own antenna.
Any switching is upstream of the low noise reciever section.

Other equipment might benefit from surgical bypass of the
TX/RX and diversity PIN diode switches. Sure makes it easier
to stack on additional amplification.

I note my HSB1 has two unused pads in line with the power
LEDs. Any bets those unused pads are for TX and RX lights!
I see no other missing parts on the top board but those two.
Suppose I graft the 100mw and 200mw lights (I never use)
and see if my intuition about those extra pads is correct?

415. KD5ZXG: Atheros XR Mode (-105db S/N ratio)

Yahoo group: DAWG-HSMM

From: Ken Peter
Topic: 409 Message: 415

http://www.atheros.com/pt/papers.html

The readers digest version:

Link integrity all the way down to -105db S/N ratio! at 250Kb/Sec
Compare 802.11b: -96db S/N required for bare minimum 1Mb/Sec
9db better to establish a bare minimum link.

The equivalent 1Mb/Sec speed XR (ODFM?) link needs only -101db
5db better than 802.11b at the same speed.

Above 3Mb/Sec XR modes rolls over to 802.11g 6Mb/Sec standard.
Looks to me like its just a slower long range version of plain old G.
Used for fallback in preference over legacy B modes.

I first spotted an option for Atheros' proprietary XR mode when accessing
my G-820 bridge by Telnet. Was absoloutely no mention of it in the GUI.
Seems it was allready enabled by default.

Later discovered XR feature on my DI-624 router. Right there in the GUI
this time, no attempt to hide it. Enabling XR disabled my 108mbs SuperG
options... It also forces SSID beaconing on.

416. oops dbm - forget s/n ratio.

Actually there are two lists, the other is a general NTMS list while
this is the more specific HSMM one. I didn't see the original msg to
you, but I suspect the writer was thinking that you might get more
response to some of these more technical questions on the other list.
However, you are right on topic, so go right ahead posting this info.
I can't speak to much of it, but it's interesting!

Matching fets can be a tricky ordeal especially in the microwave region. I presume that you are aware that the device will have to be mounted on etched material with appropriate trace widths in order to fune for best noise figure. You may want to take a look at an application called AppCad at http://hp.woodshot.com/ which can help tremendously both on figuring out matching networks and transmission lines. There are a number of tricks to getting these things matched properly and I've attempted a few times, but have had only limited success...I need to sit down and do all the math then build first!

Can't give you a straight answer here as I'm not a semiconductor guy, but you are right, the are not normally the same point although for FETs, they aren't too far apart. For 802.11 with the wide bandwidths and since we are

aiming toward the warm earth, once you go under 1dB noise figure, you don't see a lot of useful benefit. Typically, tuning for max power out is more than sufficient for our applications....would be a vastly different story than if you were doing moonbounce.

Yes, that's why you want to have a good match....but the devices typically want to see a bit more inductance for the absolute lowest NF

This will not buy you anything for 802.11 purposes....its got to be REALLY cold...like approaching 0K. But, then again, if you have liquid nitrogen to spare.....

421. NTMS vs NTMS-HSMM Email List

Yahoo group: DAWG-HSMM
Date: 2005-02-03 19:45:21 UTC
From: Douglas Kilgore
Topic: 414 Message: 421

There is a separate NTMS email list for paid members of NTMS. The North Texas Microwave Society has been in existence for many years and among it's members are some extremely knowledgeable technical guys that work with microwaves. Some of them are published authors in ARRL Microwave books. They are some of the movers and shakers that have advanced microwave in the amateur radio area. NTMS has worldwide membership.

NTMS members emphasize low bandwidth analog signals over long distances where as NTMS-HSMM members emphasize high bandwidth digital signals over short distances.

The NTMS-HSMM Yahoo email Group is more focussed on digital communication using microwave. Consider it a subset of "microwave". We are using off-the-shelf Part 15 equipment for ham purposes. Computers and software and internet are involved. Our list is oriented more toward local Dallas-Fort Worth operations but lately we have been getting persons joining the list from outside of the area just to see what we are doing.

There is synergy between the groups. We have a lot to learn from each other.

That's why I thought you might be able to get an answer about noise figures, PIN diodes, gain, etc. from the other list.

Doug Kilgore KD5OUG

From: J. Beadles
Topic: 422 Message: 422

$79 ea from Fab-corp. These things are much larger than the 14 db units. More like a slightly shallow dish washing tub. I think mounting may require a little more than the usual cheezy tripod in the wind. The WRTs are going to be lost in them.

I didn't see any WDS or client bridging modes on the router.
The 624 is just a switch + firewall + access point.

425. KD5ZXG: WDS and XR

Date: 2005-02-04 12:17:11 UTC
From: Ken Peter
Topic: 409 Message: 425

>Yowsa! We'll have to play with that. I picked up one of the
>refurbished 624s - can you make them bridge?

http://www.broadbandreports.com/forum/remark,11793749?hilite=2100ap+xr

I belive the 2100AP with 2.0 firmware is the multipurpose device you would
be looking for. Its an access point, not a switch+router+firewall. But it
does
do XR and several bridge modes. The link above explains how to enable the
hidden XR option - in telnet only.

My G-820 client bridge has WDS and access point mentioned in telnet, but
the chipset is the one Atheros sells for client bridge mode only. I doubt
the
other WDS modes would actually work, but it doesn't cost anything to try.
XR feature in telnet does work.

Does the 624 firewall router do WDS modes? They aren't in the GUI, and the
telnet port to the embedded Atheros access point seems to be unavailable.
I am sure its own signal can be repeated by WDS, but doubt it will repeat
anything else. Definately does XR. Even in the GUI (using latest firmware).

You can always hook a Firewall's WAN Ethernet port to a client bridge and
NAT to a different subnet, ssid, and channel on the embedded access point.
Basically exactly what KD5OUG and I did at Mentorfest. The 624 is far from
useless, its got a great firewall with lots of nifty features like dyamic
DNS
updating.

Now that you mention it, let's look at the receipt. The antennas list for $79 on their website, but the receipt shows they charged me about $71.25 for each.

These things list on the Pacific Wireless web site for $89. Not, so not a bad discount from Fab-Corp! (www.fab-corp.com)

I think its less than our SHARK...its just an AP with antennas.

My Equal to this is a WET11 with 800mw BDA, 12V 11AH gellcell w/5v regulator in an NEMA 25 box with N connector for antenna. I use a $5 PCB panel, omin-directional gain antenna, yagi, wave launcher or dish antenna.

CAT5 down the mast.

BTW I was interested in the NTMS using 500 ft of CAT5 in the "RACE". What kind/brand of CAT5 and what were you running it between, i.e. WET11 and LinkSys rounter/hub/switch?

I'll note for people who haven't seen this before - Itronix is a brand of ruggedized computer. They usually sell to fleet applications, and tend to be replaced en mass with the old units showing up on eBay for $100 or less.

Randy has been working on his for a while, and has gone through a bunch of PC Card and USB sound adapters trying to find one that'd work, and work on PSK31.

431. WRT54G / APRS project

Yahoo group: DAWG-HSMM
Date: 2005-02-12 14:53:32 UTC
From: J. Beadles
Topic: 431 Message: 431

A couple of days ago, I posted a msg to the TAPR APRSSIG list discussing the possibility of using the WRT54G as an APRS digi/internet gateway and as a telpac controller. After that msg, we've gotten over 10 new members to the list who are interested in that project.

Welcome!

This is the North Texas Microwave Society - HSMM working group, formed last year after the Dallas Area Working Group - HSMM merged with the NTMS. The major purpose of the NTMS is to study the practice and operation of microwave equipment. The HSMM working group extends this purpose by adding high speed networking, in line with the ARRL's HSMM working group. Information on the HSMM WG is located at http://www.arrl.org/hsmm/. Information on the NTMS is at http://www.ntms.org/.

As with the NTMS parent org, the NTMS HSMM WG focuses on operational installations in the North Texas area, but all are welcome to participate.

Over the past year, we've been experimenting with putting up operational, if temporary, HSMM networks. We've been putting up networks at special events like the Richardson Wild Ride (bike rally), Hamcom, and Mentorfest, gaining experience and knowledge.

In the local area, we've been pushing APRS operation and now have a large network with a lot of users. There is also a drive afoot by the ARES outfit in my county to implement Winlink so that we will have a more convenient email capability then just using raw packet. The thinking goes that the more users we have using APRS with real TNCs, the more users we'd have who would be able to switch to Winlink if we had to deploy them to Hospitals in a mass casualty situation.

Our experimentation with the WRT shows that it could be extremely useful in supporting both APRS and Winlink. A repackaged WRT with, say, a TNC-X attached would have a total cost of around $110, which is one heck of a lot cheaper than packaging a PC to do the same job. Add in the wireless bridging features and we have a package with a heck of a lot of potential.

Now I, personally, do not have the programming skills to make this work. I could get competent to work on it within a year or so, but have enough other tasks to do that I'm probably most productive focusing on those instead. I'm happy to gather requirements, beta test, write up presentations, but I figure most of the development work will be done by those of you with the interest and ability to

dive down into the hardware.

Here's what I've collected about the WRT hardware: http://www.n5oom.org/hsmm/wrt54g.htm. I'd recommend the Seattle Wireless discussion, and the SVEASOFT forums (though that costs $20).

Dig in!

434. Digined on WRT54g

Yahoo group: DAWG-HSMM
Date: 2005-02-14 01:50:05 UTC
From: Wes Johnston
Topic: 434 Message: 434

Guys, I'm just sitting here thinking about the WRT54g... it has 3 network cards...LAN , WAN, WIFI, and 2 serial ports. So we could hook up 2 TNCs and bridge two frequencies together. All we need to do is to install the ax25 stack on the box and install digined... or digined with only KISS support.... Couple that with Opentrac's idea of sending packets to the broadcast subnet so that clients only need to listen to UDP packets on, say UDP port 14439... and we have the "killer app"....

Wes

435. KD5ZXG: LNA-6G test 802.11b (recieve only)

Yahoo group: DAWG-HSMM
Date: 2005-02-14 09:08:23 UTC
From: Ken Peter
Topic: 38 Message: 435

Still my intention to design an build my own LNA and power amp for 802.11b
I still need more study on the problem of biasing and matching a FET for lowest
noise. I got lazy and wanted to see how it was done by someone who knows.

I picked up an LNA-6G from RF Bay as a commercial reference for comparison.
Not bi-directional, playing in enhanced recieve mode only (netstumbler survey)
The LNA-6G noise figure is claimed to be 1.6 at 2500, and +20db gain. Nice!
I can't speak for the noise figure, but the gain (compared to an SMA barrel)
appears to be right on the money.

The package is labeled 12VDC, but a peek inside shows an LM78L05 regulator
that may run from as little as 6.7V (or as much as 35V if it doesn't overheat?)
I ran my tests from a 9V battery. The MMIC inside is marked 867. I have not
yet been able to identify the manufacturer (Agilent perhaps?). There does
not appear to be any biasing for a FET. It can't be anything but a 5V MMIC.

Anyways, I am using a circulator and dummy load to protect this LNA from the
200mW output of my radio card. The LNA is right at the antenna, before any
PIN diodes. Its working great! I can see all sorts of stuff that was previously
too weak and/or hidden in the noise floor. The circulator blocks any TX and
passes RX (located on the reciever side, not between the LNA and antenna)

It definately beats the +8.4db Hawking booster for RX! It was always sort of
debatable if the Hawking was helping RX at all, absoloutely no doubts with
the LNA-6G.

I could probably use two circulators to bypass my outbound signal around the
LNA with a single antenna. But I need to make sure I have enough directional
isolation, filtering, and/or attenuation that no frequency will see any loop
gain.

I have no idea how well "RYT 300163 1.7 - 2.7Ghz" circulators isolate outside
thier rated passband? Within the passband they isolate probably around -20db,
very close to the gain of the LNA. The LNA-6G has gain well above and below
the band of interest, I worry the directional isolation of these circulators alone
might not be enough to stop oscillation through the TX bypass at some other
frequency?

I also snagged Qty4 5V VCOs for 2300-2450. I only need 1 for CW reference,
or possibly team one up with a sawtooth to do some sweeps. If anyone else

has a project idea for a VCO, ask before they are gone. I also have Qty4 that
I bought by mistake covering 2156-2224 and run from 6V, I have no plans for utilizing any of those.

From: jbeadles@pobox.com
Topic: 38 Message: 436

Wow! I'd be interested in running abound with that with a card and netstumbler to see what happens. I'm interested to see if the extra receive sensitivity adds extra noise againsed the desired signal. I see one of those LNA-6Gs on ebay for abt $79. If you can work out the components so we could make a cheaper version, that'd be massively useful. Maybe do a circulator on the PCB, at least I seem to recall that is possible, isn't it?

Will that dump packets out to the APRS-IS network? That ultimately is where we need to go. It would be pretty cool to make this a server too though.

438. Network adapter

Yahoo group: DAWG-HSMM
Date: 2005-02-14 15:30:33 UTC
From: Mr rusty bryant
Topic: 38 Message: 438

Hello,
I am new to all this but have been playing around with
wireless networks for a few months.

Now for the questions:

1) Whats the best USB network adapter on the market?
not looking for a router or AP yet, just an adapter.

2) How do you changed the specific channel that your
adapter is using so that it will TX and RX on only
that channel?

Thanks!

Rusty

439. More vendors

Yahoo group: DAWG-HSMM
Date: 2005-02-14 15:30:09 UTC
From: J. Beadles
Topic: 439 Message: 439

Whilst looking for more cheap cables, I ran across a number of additional vendors. Most are so-so but have one or two stunning prices.

http://www.wlanparts.com/ (Look under cables and connectors for the $3.99 1ft N Female Bulkhead to RP-TNC)

http://www.crownelectronics.com/assemblies.html
http://wisp-equipment.com/pigtails.html
http://www.smelectronics.us/microwavecablesman.htm
http://www.connectronics.com/wifi_plus/

Incidentally, I need four pigtails, N Female Bulkheads to regular male SMA, 1 foot, if anybody knows where to get them cheap. I can find the RP-SMA connectors, but not regular SMA.

440. Re: [ntms-hsmm] Network adapter

Yahoo group: DAWG-HSMM

From: Keith Berry
Topic: 38 Message: 440

Hi Rusty,

I will try to answer the questions.

1. Whatever is on sale
2. It is in the manual (maybe)

Seriously, for question one, the brands are varied and they all have their strengths and weaknesses. I have found the Linksys to be pretty good stuff and they usually have more features usually than some other brands in their price range. The best bet is to look for one at a good price and try it out. Only other advice on the if you can get one with a detachable antenna, then you can hook a gain antenna up to it.

For question two, the only way I have seen you can lock a channel down is in Ad-hoc mode. The channel is usually derived from the AP or Router, so the client adapters will scan the channels in infrastructure mode. There may be some out there that will lock in on infrastructure mode, but I am unaware of them. You can go out to most of the manufacturers web sites and get manuals ahead of time that will tell you what features the units have.

Hope this helps.

Regards,
Keith KE?FV

There should be support for multicast as well so that the network can be
extended as far as necessary and still see the TNC traffic. Imagine
several networks in a TNC with many desktops/stations able to have
accurate and up to date APRS data...

442. Larger Guage CAT-5 Wire???

Yahoo group: DAWG-HSMM
Date: 2005-02-14 17:40:49 UTC
From: Douglas Kilgore
Topic: 442 Message: 442

Ethernet over CAT-5 wire is limited to about 300 feet. Regular CAT-5 wire has 24 guage conductors. Trying to do Power-over-Ethernet gives quite a voltage drop over that distance. One way to overcome is use higher voltage. Another is to get larger diameter wire.

POE Loss Calculaotr:
http://www.gweep.net/%7Esfoskett/tech/poecalc.html

Therefore, does anyone know of a cable suitable for Ethernet use with larger guage wire? The ideal wire would have 2 unshielded twisted pair plus 2 larger conductors of say 16 or 14 guage. And also outdoor rated.

Doug Kilgore KD5OUG

443. RE: [ntms-hsmm] Larger Guage CAT-5 Wire???

From: A.J. Farmer (AJ3U)
Topic: 442 Message: 443

The best way to do this is to inject more power than you need and regulate it at the far end. For example, these units inject 24V onto the cable, and have a 12V and 5V regulated "pick" at the far end. That way voltage loss and cable length is not a problem.

You can actually already do that with the standard APRS-IS server
in, for example, UI-View. How does that actually work? We need to
get AE5PL in here, he knows that stuff.

Problem is getting a really cost effective voltage converter to bring it back down to something reasonable. The WRT has a DC-DC converter in it that is capable of 45v, but from what I've been reading, the caps on the board are only rated to something like 24v.

My thought is to get Kent Britain to make up a stack of cheap PoE boards that use that same voltage regulator, but the adjustable one. That way you could adjust it for whatever voltage you wanted and it'd probably be cheaper than the commercial units.

Most units have standardized on 12V and 5V these days so that is why the POE kit has regulated outputs for both. Doesn't the WRT require 12V like other Linksys routers? This kit is not just the injector, it also includes a regulated DC-DC converter at the equipment end:

http://www.jefatech.com/product/poedual125

By the way, you can use code HSMM when you check out to get a 10% discount at JEFA Tech.

That Jefatech unit is about the cheapest I've seen, though it does require an AC input, which is a bad thing from a flexibility standpoint. If we deploy out in the field, we're going to be running on the old 12v batteries.

Most of the other commercial units I've seen, at least the consumer ones, run either 5v or 12v but are not switchable, which is bad from a flexibility standpoint. We did a short term tower install where we had to put a switch with the APs last year, and the switch was a 7.5v unit. Also, we've had situations where we've run 12v APs, with 5v webcams.

I like the idea of having my own POE voltage regulator, simply because having to build up a set of equipment seems to be a poor way to operate. If I do it, it'll be jumper selectable for voltage and whether or not it passes the power through the adapter, so I can daisy chain PoE regulators with different voltages.

The WRT uses a DC-DC switching regulator capable of accepting 45v. However, I'm given to understand that the caps are only rated for something like 20v to 24v. Therefore we can't really directly dump a a voltage much higher than 18v into the WRT. However, if I can use those regulators in my custom PoE pickers, I should be able to run from abt 15v up to 45v on the injector.

On a personal note, I'm kind of liking 24v just because I can use a couple of lead acids for field power.

The Noise Figure (+1.8db) is the ratio of Signal/Noise in the output
over the original Signal/Noise of the input. Considering there is +20db
of RX gain added, that figure seems astonishingly good. Most MMICs
and 802.11 integrated LNAs have noise figures closer to +4db with
much less gain (+12 ~ +16db). Any PIN diode and other losses or
noise in front of the LNA make the situation even worse. It is very
important to have the lowest possible noise in the front end. But
you still have to withstand the high adjacent channel interference
without intermodulation (mixing the two signals non-linearly).

I won my LNA-6G for $39.99 (ebay auction, not "buy now").
They also sell another one thats only good for 2.4ghz and doesn't
cover up to 5.8Ghz, I forget the model of that other unit. I don't
recall there being any price advantage for the lesser model...

In any case. I think we can build something better for cheap.
Even un-optimally input matched to plain old 50ohms, the noise
figure for the FETs that NTMS is floating should beat the LNA-6G.
Properly matched, the noise might even go as low as +0.25db.
And I will be running a pair in quadrature to handle double the
QRM without distorting the signal of interest. Thats the sort of
experiment where I am wanting to go.

I don't think you can print a circulator on a PCB. They have very
strong permanant magnets, and some sort of cavity inside. You
can do 3db hybrid couplers, but thats not quite the same thing.
2.4ghz circulators on ebay are running about $15. You might
also look for "Isolators" the same thing, but with a terminating
restistor on the 3rd port. Sometimes they can be removed.

I'm not worried about noise figure, so much as received noise from
the hundreds of local APs we will now here.

I don't doubt you are right, I just can't get a particular image out
of my head. I'll do some research. I did see a circulator that HD
communications sells that is a teeny device with solder tabs. Didn't
see a price, though. Incidentally, I do have some 4GHz and 6GHz
waveguide circulators if you are ever in the need.

Here you go, look at this:

http://www.novamicro.com/products/dropincirculator.html

Hm, here's something that's not applicable, but is still interesting:

Remember the legacy 10base2 BNC connector on old hubs?
We can get our hands on some pretty substantial 50ohm coax.
Sometimes even with an extra strip of wire attatched.
Over generic RG58, the old 10base2 was good to 185Meters.
Imagine how far you could go on RG213 or LMR400!

Then again, if you want to run some real power, you might look
at tacking the problem backwards... Ethernet over powerline.
I don't know the distance limits on that sort of connection.

This is the classic problem with adding a preamp in front of receiver: it amplifies everything, and almost always reduces the receiver's ability to reject adjacent channel interference.

In the case of WiFi in a metro area, the interference is also on the same channel, so I don't think the noise figure should be as of much concern as the increased effect from interfering signals.

73,

Bob K5WO

454. 05 Hamcom Presentations

Yahoo group: DAWG-HSMM
Date: 2005-02-15 15:43:03 UTC
From: J. Beadles
Topic: 454 Message: 454

All,

I need everybody to be thinking about Hamcom! As programming director, I need to begin the process of locking down the presentations that we're going to have. We have all three days, and we have the convention center until 9pm each night, so we have plenty of time for stuff. Currently I have:

1. Intro to HSMM - Me
2. HSMM for public service events - Me
3. Introduction to IP Networking - KC7IIB
4. Using the WRT54G for HSMM - Me

Joe, are you up for doing the microwave propagation presentation again?

Anybody else? Please? Pretty please with sugar on it?

Also we need to be thinking about how we're going to put an HSMM demo into the convention center. I talked to Doug KD5OUG about this, but he says he may not be available this year.

456. Power Over Ethernet - My View

Yahoo group: DAWG-HSMM
Date: 2005-02-16 03:50:31 UTC
From: Anthony Campbell
Topic: 456 Message: 456

I have been kind of setting back and watching the discussion about POE. I would like to toss this idea out. First off, lets face it?Ham radio stuff is powered from 12 vdc. If we use anything else we are just looking for trouble unless you go with true spec compliant POE; you know the ?48 vdc stuff. I have been looking around and have found what I think may be a pretty good solution.

National Semiconductor has the LM2585 Simple Switcher 3A Flyback Regulator. These are really simple DC/DC converters. They have both 5 vdc, 12 vdc and adjustable output models. It looks like you can build a unit up with only 10 parts. This circuit would allow for 8 ? 16 vdc input. This will more than accommodate the loss of 300 ft of standard CAT5 cabling and allow the unit to run off a single battery.

OK, so what do you think?

Tony

Not bad. The max input voltage is only 40v, though it can provide
multiple output voltages and has a 3amp output. Cost is $3.17 ea.
Web page is:

http://www.national.com/pf/LM/LM2585.html

The application notes indicate that it should not need a heat sink in
normal use: I get the following parts counts, not including the
regulator:

1. 1 output flyback: 9 parts
1. 3 output flyback: 14 parts
2. 1 output step up: 9 parts

The flyback versions require a transformer, by the way.

Lookit the LM2592, which puts out 2a with an input up to 60v. Cost is
$2.35. Parts count of about 4, or 9 for an adjustable version.
Needs a heat sink, though. Also radiates, likes ground plane
construction.

http://www.national.com/pf/LM/LM2592HV.html

This one puts out .5a, costs less than a $1 and doesn't require a
heat sink. Would work for a WRT, which burns less than that.

http://www.national.com/ds/LM/LM2574.pdf

Ken, did you get a current drain measurement from those Hawking power
amps?

Yeah, but... Last year Joe and I did a 360 degree rooftop survey and got over 300 APs. In the last month, KC5QHH did a netstumbler survey between work and home and found hundreds and hundreds. The cumulative effect for any given path may be as a continous noise source.

This will make a nifty experiment! Way back in ancient times when I was doing microwave coordination, we had charts of interference effects, adjacent channel and co-channel for different modulations. I'm interested in setting up some interfering point to point paths in different orientations an open field and observing the effects.

If we can get NT5NT set up with a WRT setup on the tower, let's do a couple of drive tests against it, with and without the preamp and record the effects of local interference. That would make an interesting research paper.

Donj't forget the 2.4 Ghz DSSS phones that are sold by every computer
store and office supply and Sams. They won't show up on NetStumbler.
You need Bob Kmak's 2.4 Ghz spectrum card to see what's going on.

That was what we had problem with at the Plano Ballon Fest.

462. More on DC/DC Converters and PoE

Yahoo group: DAWG-HSMM
Date: 2005-02-17 01:24:00 UTC
From: Anthony Campbell
Topic: 462 Message: 462

Great email and suggestions on the converters. Help me understand this just a little better.

My initial suggestion was an LM2585. This unit allowed for step-up operation but did require a transformer to do so. But in my premise step-up operation is required to overcome the IR loss in the cable and still use a 12 V battery to power the system.

If you look at the LM2592, it does have a higher input voltage (but why would I care?), but does not seem to offer a step-up option. Did I miss something in the datasheet?

The LM2574 seems to have the same issues.

I guess I have a few questions. I am really hard over on only using 12 vdc as a primary power source. You don't appear to be as concerned about this. What do you think the pro's and con's are? What is the max current we should be designing for?

I guess what I was hoping for is concurrence on a design to use so that we could have some boards made up. In a reasonable quantity these converter could be low cost.

Where do we go from here?

Tony

From: Ken Peter
Topic: 456 Message: 463

>Ken, did you get a current drain measurement from those Hawking amps?

Just now hacked up a power adaptor for ya .
With the Hawking's switch on a 500mW setting:

76mA just sittin there doing nothing.
150~250ma transmitting (bandwidth test).
240~250ma recieving (bandwidth test).
Don't ask me why RX draw is higher than TX?

I didn't see my meter flash any number higher
than 250ma. Thats with the OEM 12V adaptor.
Thats about what? 3Watts drain for 0.5W TX?
My Wavetek27XT was set on a fused 20A scale.
Pegs next lower 200ma scale except when idle.

URL for the bandwith test I used:
http://www.pcpitstop.com/internet/default.asp

Outstanding! Combining that with 450ma for a WRT, we now know that
we can run both for less than an amp. Might be able to shut the LEDs
off on the WRT and drop it down a bit more. Thanks!

Ah, I see where you are going. What we have here is a failure to communicate! You were looking at the step up, while I am looking at the step down on the receive end of the PoE hardware. One of the things to consider, whilst making this decision, is what will happen to commercially available eqpt in the future.

The equipment that we are using now, mostly has no existing PoE capability, so we are having to go through these contortions to make things work. However, now that there is a PoE spec for commercial hardware, we will likely see 48v standard equipment in the future that we will want to use. It seems to me that if that happens, it would be beneficial to have a picker that has the capability of accepting voltages that high. Personally I have found one of the Proxim Harmony 6 port PoE units that puts 24v on the line.

So, what I was looking for was a regulator that would reside on the upstream side that would be capable of accepting any voltage up to 48v. It'd still be totally feasible to use something like the 2754 as a boost regulator, but use something like the 2592 on the upstream side. This would give us the flexibility to use virtually anything that is available, and I see that as an advantage.

On an aside, I opened up one of those little d-link 5 port ethernet switches last night. Looks like the unused pins on the ethernet connectors aren't connected to anything. I'm thinking about wiring an injector right up to them.

Very interesting. I think we need to separate this
discussion into two issues. The first is using true
IEEE spec PoE equipment. The paper that was posted
the other day gave a very good explanation of this.
It looked to that that was one of those specs that you
were either fully compliant with or it would not work
at all. Since it does not look like you will just be
able to send -48 vdc up a cable and power the device,
I am not really sure how this should be approached.

I see our/my short term problem is one of having to
power access points, amps and routers that are either
temporarily or permenately mounted up on poles and
roofs. That is why I focused on the requirements of
powering them from 12 vdc. When we get critical mass
on the WRT54G's I could see us stringing these things
along a route to get connectivity from one point to
another on a adhoc basis.

I agree with the outstanding. I would be interesting
measure the current with somethink that has a quicker
response time than a DVM. The peoks might cause and
switching regulator to shut down.

Just a thought,

So what has to happen before the 48v is put on the line? I'm looking at both sides - not only having PoE powered gear, but also having the PoE inserters available to us. What has to occur before the juice is turned on?

Don't worry too much about WRTs specifically. If I read it correctly, the regulator in the v2 WRT powers the device at 3.3v. If so, the device should be able to take a substantial drop from 12v and still operate. I don't have a variable PS handy to try it, but will be a useful experiment. Other eqpt may not be so forgiving.

For what its worth: My current measurements for the Hawking
were done with an unmodified amplifier and the original dipole.
Not my hack with the add-on RX/TX LEDs. Not with any of my
experimental antennas of unknown SWR.

I guess battery conservation freaks might want to remove the
100/200/500 mW LEDs off the Hawking as well?

Heh heh heh! Well, 20ma each is 20ma each! Don't suspect it'll be an issue in too many appllications. Been thinking about putting a bridge in one of those high altitude balloon flights for grins and giggles, and nobody'd be up there to see the blinkey lights.

471. 12 Volt 7 AH batteries

Topic: 471 Message: 472

Strikes me that boosting the full range of 4-48 Volts
up to 48 then back down to 5-15V is rather difficult.
The boost circuits (suggested by National) just don't
adapt over that full range unless you make them a lot
more complicated.

Perhaps its easier to take any POE voltage of 4-48V
down (LM2576HVT-3.3) then back up (LM2577)?
I think you could squeeze out the better part of an amp
pretty easy. No flyback, and only 12 simple discretes.
4 downside, 8 upside. Using pretty much the default
circuits as described in the appnotes.

I am not promoting low voltages over the CAT5, I am
in agreement that 48V POE is the most efficient.. Only
suggesting how the simplest circuit might deal with any
conveniently available voltage seamlessly at the far end.

473. The Case for 24 Volt PoE as an option...

Yahoo group: DAWG-HSMM
Date: 2005-02-18 15:15:50 UTC
From: Randall Dunning
Topic: 471 Message: 473

My system, trailer and all, is 24 volts. To get radio equipment running 12 volts I have to use either a 24V to 12V converter or run my big 4KW 24V to 120V ac inverter and a power supply. Not bad for occasional radio work but the power conversion losses would be exceedingly wasteful to run a WRT, a WET-11 and a Hawking amp or two 24/7. The inverter, which is a VERY efficient unit, would still draw a couple of amps at 24V when running. A 12V to 24V DC converter large enough to power HF and VHF radios has similar conversion losses. Add to that a power supply (yet another "conversion") and my conversion expense would exceed my equipment power requirements several times over!

Since I use 6 75W solar panels and therefore am on a strict power budget (Yes, the trailer has a shore power option) I need to avoid conversion losses. Thus I suggest a solution that allows voltages from 10 to 60 volts as being optimal. Then we don't care what is on the line and are able to make use of whatever power insertion option is available. Then we can use a 16-60V picker to get back to 12V or 5V.

In this case I think creating a PoE transmission line power level standard would be counter productive and would actually work to compromise the mission of providing flexible, field deployable high speed data solutions.

Another point is one of safety. If you read the manuals on field telephony, you will see that 48 volts is the upward bound of what is considered "low power" DC. Never the less, it is really on the top edge of the "safe" DC voltages.

If you look at the efficiency difference going from 12 to 24 volts you get about a 40% increase in efficiency by my reckoning. If you go from 24 to 48 you only get 20 to 25% more efficiency. 24 volts is right smack dab in the center of the "safe" low power DC range and gives, IMHO, the best trade off of efficiency, safety, and ease of use. For "ease of use" I simply point out that it is easier to keep up with a 24 volt serial string of 12 V batteries than a 48v serial string. That is why 24 V is still the most popular low voltage system in the alternative energy community. It is the point where safety, efficiency and ease of use converge.

Some reasonable HSMM equipment friendly calculations for PoE application: 24 watts over Cat 5e (24 AWG) wire @ 50 feet

12 V @ 2.0 a - 51.7% drop: 6.2 V, Delivered : 5.8 V
24 V @ 1.0 a - 12.9% drop: 3.1 V, Delivered : 20.9 V
48 V @ 0.5 a - 3.1% drop: 1.5 V, Delivered : 46.5 V

Cheerio and 0x49!

RD - KC5QHH

* 0x49 is 73 in HEX.

From: Douglas Kilgore
Topic: 471 Message: 474

Remember that you have 2 PAIRS to send POE on Cat5.
So 2 - 24 AWG = 1 - 21 AWG wire.

So for 50 ft Cat5 the down and back length is 100 ft.
Resistance = 100 ft x .0128 ohms/ft = 1.28 ohms.
Voltage drop = E =IR = 2 amps x 1.28 ohms = 2.56 say 2.6 volts
Am I missing something?

So using a 12 volt gel cel which has a discharged voltage of 10.5 volts,
will our equipment work reliably on the reduced voltage?

10.5 - 2..6 = 7.9 volts

I think some of it can. But we will have to test to confirm that.
And if we don't pull the whole 2 amps, the voltage drop is less.

Sounds like good material for a follow-up QEX article, if systematically done.

If it is a less rigorous study, it might be good stuff for a CQ VHF article.

In either event, if we don't get the word out and DOCUMENT our test results, we rely on armchair engineering speculation, and goodness knows our HSMM efforts have suffered enough from that already.

476. More WRT / APRS project thoughts

Yahoo group: DAWG-HSMM
Date: 2005-02-20 13:34:30 UTC
From: J. Beadles
Topic: 476 Message: 476

Y'know, I was thinking about how to further reduce the cost of a standalone WRT based digi, and something came to mind. A cheap WRT at $49 combined with a TNC-X at $45 potentially results in a total package of less than $100. However, to use the serial ports, you have to add a daughterboard with MAX232 level converter to get the port from TTL level up to RS232 levels. A commercial daughterboard runs about $20, increasing the unit cost.

But looking at the TNC-X, it also uses a MAX232 for line level conversion. Then it occurred to me that as long as you don't need an additional RS232 port for something else, you should just be able to hook the TTL level connections directly together and avoid the level conversion altogether.

It's been mentioned before that the simple thing to do would be to compile digi_ned and attempt to use it. Digi_ned is available here: http://www.qsl.net/digi_ned/. Anybody interested working this angle?

Check the polarity of the digital signals. Some 232 level converters
invert the data lines. If so a simple nand gate or transistor can take
care of that.

Yep. They are both max232s, so they should invert the same on either end. I think.

I started to investigate the WRT after you mentioned it on the APRS-SIG. One stumbling block I have already hit is the change in the Linksys hardware. They are currently on version 3 of the hardware for the WRT. The the end user, there is no difference, but for someone trying to write custom firmware, this can cause a problem.

The Sveasoft and other custom firmware out there only works on v1.0 and v2.0 WRT hardware. Fortunately, I had a v2.0 WRT in my shop. The custom firmware worked great. When I went to get another box for testing, I checked the local stores and they are chock full of v3.0 WRT hardware which will not work. Older WRT's are nowhere to be found. I went ahead and bought a v3.0 box, only to find that the Sveasoft firmware which was working fine on my v2.0 WRT was not compatible with the new v3.0 WRT.

Point of the e-mail is that this WRT based digi is a great idea, but we are relying on Linksys for the hardware. If we get something up and running, it may become obsolete and require a re-code if Linksys decides to change the hardware again. It's not a show-stopper, but just some food for thought.

The porting of Digi_ned sounds like an excellent idea and would definitely jump start this project!

Subject: [ntms-hsmm] More WRT / APRS project thoughts

Y'know, I was thinking about how to further reduce the cost of a standalone WRT based digi, and something came to mind. A cheap WRT at $49 combined with a TNC-X at $45 potentially results in a total package of less than $100. However, to use the serial ports, you have to add a daughterboard with MAX232 level converter to get the port from TTL level up to RS232 levels. A commercial daughterboard runs about $20, increasing the unit cost.

But looking at the TNC-X, it also uses a MAX232 for line level conversion. Then it occurred to me that as long as you don't need an additional RS232 port for something else, you should just be able to hook the TTL level connections directly together and avoid the level conversion altogether.

It's been mentioned before that the simple thing to do would be to compile digi_ned and attempt to use it. Digi_ned is available here: http://www.qsl.net/digi_ned/. Anybody interested working this angle?

Yep, that's absolutely true and no two ways around it. v3! I better
get back on the sveasoft list and read up.

I'm sorry to hear you wound up with a currently untestable v3. A
friend of mine accidentally got the v2.2 and didn't want to buy the
subscription. I already had 7 v2.0s and had a subscription, so I
traded him for a v2.0 and put Alchemy on the v2.2.

Without having studied up on the v3, what I can tell you is that with
the v2.2 (or v1.1 speedbooster) unit, Linksys changed the ethernet
controller, necessitating a new firmware revision. The way Sveasoft
is doing it, they have their "release" firmware, currently titled
"Satori", which is made publically available. This handles hardware
revisions up to v2.0 (or v1.0 of the speedbooster version). Then
they also have their newer pre-release version, "Alchemy", which
works on vthe v2.2 (or v1.1). The pre-release versions are not
publically available, you must have a subscription to get access to
it. I have Alchemy running on one of the v2.2s.

Sveasoft is advertising their planned follow-on firmware, Talisman,
which I think exists only as a plan for now. Talisman would make
their code modular, so that you compile what modules you want to
include in the firmware. They are advertising several "focused"
releases, including a mesh version, a hotspot version and a voip
version. I'm thinking we could get a ham specific version included
if we can define for them what we want.

Yep, that is absolutely true. However, it's not all that bad - The WRT is based on a broadcom reference design and apparently a number of other manufacturers use that design and their units may also be modifyible in this manner.

I've been worrying about just what you are talking about. I came to the conclusion that based on the price point (<$50!) and numbers sold, that even if Linksys ultimately moved to a hardware revision that would not be compatible, it would still be worthwhile to search the used hardware market (ebay) to find one that would work. Rather like impressing old Motorola radios into repeater installations.

Actually this is encouraging to me. I've been half expecting for somebody to tell me why this all wouldn't work at all, and so far that hasn't happened.

> The porting of Digi_ned sounds like an excellent idea and would definitely
> jump start this project!

Sure would! Since I'm not the guy who will be coding this up, you guys will get to correct me, but I've been under the impression that this shouldn't be all that hard to do for one of you hard core linux users. The source for the existing release is available (open source, natch!), so it seems to me that it is a case of getting the right compiler, adding the digi-ned source into the existing firmware source (satori, or alchemy when it is released), along with replacing stty and any other serial port handling software and just recompiling the whole package for that release. Is that a reasonable view of what has to happen?

From: Bob and Debbie Kmak
Topic: 476 Message: 483

John,

I've started looking pretty seriously at aprsd, and IGate server for Linux. It's what you might call feature-rich, but probably could be stripped down to the needed features and then maybe shoe-horned into the WRT54G memory space.

Does anybody know how much space is available in the WRT54G image? Or a way to query it? I've just subscribed to Sveasoft to get the Alchemy sources; maybe I should ask that question there.

BTW: The cross-compiler for building the WRT54G image comes with the Linksys source package. It's what they call the 'toolkit'. I've been able to build the linksys image on my Linux box, and hope to try it out on my v2.2 WRT54G soon. If that works, then I'll overlay the Alchemy sources, build again, and see if I can get that going...

73,

Bob K5WO

Again, not being a Linux expert, theoretically you should be able to
telnet into the box and use the usual unix commands to see what is
free. I seem to recall doing something like this, but being unable
to deciper the results.

The Seattle Wireless hardware discussion indicates 16mb of ram, 4mb
of flash on the v2. Other discussions indicate that these are
doubled in the v2.2.

One of the things I've noted about the upcoming Talisman release is
that they are intending to leave a little virtual disk space free for
this sort of thing.

This is the same equipment the WWW.biovlan.com in North Dallas is using. The mesh network uses type accepted equipment and uses 2048 bit encription. A ham radio operator can operate under part 15 as Joe Citizen but if he adapts the equipment or uses a non-type accepted system, doesn't this mean he is operating under part 97? And how can a ham use encription?

Tis a puzzlement!

From the ntx_aprs_ug group...

------- Forwarded message follows -------
To: <ntx_aprs_ug@yahoogroups.com>
From: "AE5PL Lists" <HamLists@...>

I have compiled javAPRSSrvr using gcj with the Pentium as the target. The size was just over 1 megabyte. If someone wants to compile it for the WRT54G, I will be happy to help get them the correct code for experimentation. Here we have the ability to have a complete APRS server, IGate, and digipeater in one network appliance. And, there is some work going on right now that puts a Winlink TelPac node on Linux. If both would fit, that would be quite a useful ham radio tool indeed.

Hey A.J., can you verify the v3.0 hardware? I'm seeing on the
sveasoft list where somebody else mistook a v3x firmware load for a
hardware revision, but it was really v2.2. I'm not doubting you,
just thinking that it's worth a look.

Yes, it is definitely 3.0. The serial number starts with a 7 (compared to a 5 for the 2.2 version). I don't have it in front of me right now to give you the exact serial number format, but the "7" sticks in my mind. The box would not accept the Satori or Alchemy firmware. It rejected the upload.

On the Linksys support page, they now have four different firmware images for download for the WRT54G - v1, v2, v2.2, and v3. They also have v3 GPL code available for download.

I don't know what is different about the hardware at this point. I'll investigate further and post my results and some pictures of the v3 board.

180mA?, yikes. Also, looks like a metric pitch spacing 20 pin header. I'm concerned that you'll spend money getting the antenna connector and connection header that will bring it up on a par with a garmin GPS 18.... The serial port polarity is likely to be "upside down" too, necessitating a max232 converter. The 1pps is nice though... I have a GPS with 1pps and wired it to an LED so I know when the critter has a fix.

The mark "axiom" was a valid GPS mfgr, though they seem to be out of business. Seems to have reasonable specs. I'd probably try one of these.

496. Something on the TNC-X front...

Yahoo group: DAWG-HSMM
Date: 2005-02-23 21:38:45 UTC
From: J. Beadles
Topic: 496 Message: 496

Looking at attaching a TNC-X to the WRT. A TNC-X is a kiss-only TNC that runs about $45 in kit form.

http://www.coastalchipworks.com/PICTNC.htm

One of the things I've been worried about is, does the TNC require any serial port handshaking. Survey says, "no!" In fact, it requires no handshaking at all. So this should be ideal for hooking to a WRT serial port. I put in my order for one.

Not only does KISS mode "not require" handshaking, it "demands no" handshaking.

Your tale gets even better.... the TNC-x can be jumper selectable between TTL and rs232... so you don't need to make the rs232 daughter board for the wrt54.

If you get kernel ax.25 support to work with the libax25 tool library, I am going to post a jar file to the javAPRSSrvr users group which compiles under gcj. The compiled code is just a bit over 1 meg for a Pentium. Anyone who wants to try and compile and test it for the WRT can contact me directly and I will get you set up. If this gets put on a WRT, you will have an APRS server, IGate, and digipeater (capable of N-n and no-source-route digipeating) in a network appliance.

I have had a TNC-X for quite a while. I use it with an old laptop (serial port) running UI-View. All works great. I cobbed up a USB cable to furnish +5V to the unit. Jon also has an add-on for full USB operation. Kit is very easy to build and came up on the first try.

Pete,

1 meg? I don't think we have that kind of room on the WRT54G. Does javAPRSSrvr also require the Java Virtual Machine? That would be another problem. I'm not even sure there is a Java cross-compiler for the Broadcom MIPS cpu.

Am I missing something obvious?

gcj is a compiler which takes Java source or intermediate (class) code and converts it to machine code. It is based on, uses, and is included with gcc. Therefore, it should be able to cross-compile to the MIPS cpu. There is no JVM required. The 1 meg is based on compiling for the Pentium. I would guess a little variance for the MIPS, but not significant.

Should only a digipeater be needed, we could create a server "stub" which would eliminate the server and IGate functionality. However, I believe it would be of best use to be able to provide all three services in an HSMM environment.

I wonder if the TTL levels are 5v tolerant? You know, since the WRT runs on 3.3
v internally.

Pete,

Thanks for the info. That it could be compiled to native code is encouraging, although I still think the 1 meg file size would be a problem. What is the ax.25 support needed for, if we use an external TNC? To parse the text packets coming from the TNC?

73,

Bob K5WO

This is a link to a web-based propagation tool.

------- Forwarded message follows -------
From: Kent <kentp@...>
Subject: Re: [ARRL-80211B] Hinternet Expanded...Help with antennas/systems

John,

For whatever reason, I subscribe to the listserv, but it won't allow me
to post to the group. Here is one URL of note. It is much easier to
use this Longley Rice engine than trying the various Linux programs out
there and this is easier to use than Radio Mobile albeit not as precise.

(Credit due to the Green Bay Packet group)

Will the project leaders get in touch with Rick Lindquist, N1RL@...,
concerning this project.

I mentioned this to Rick and he thinks this would make a good news item.

Thanks,

Walt/K5YFW

Can you give me a bit more context here, Walt? I assume this technology
is being used on amateur frequencies, yes? I've heard of wireless mesh
but that's about it.

Topic: 496 Message: 512

The ax.25 support provides the KISS to socket interface. Java has no direct serial port support so we use the ax.25 kernel support in Linux (we also support standard TCP/IP connections to AGWPE and KipSS TNC interfaces which run on Windows). The ax.25 kernel support doesn't do any parsing of the packets (for APRS packets). It just passes the KISS formatted packets to/from a simulated socket.

I did do a compress on the runtime file and it compresses to about 350k so it could be stored in firmware compressed and then expanded into RAM at startup.

Hey A.J.,

I have doubters on the other list, though I'd suspect that the statement that neither Satori or Alchemy will load should be persuasive.

1. What part of the country do you live in?
2. What store did you buy that from?
3. When you have a minute, can you possibly get a pic of the equipment plate on the bottom of the case? It should say v3 on it.

Topic: 496 Message: 514

Well, now I fell awfully silly. Allow me to open mouth and insert foot. ;-)

Yes, these are v2.2 boxes, not v.3 as I had thought. I found the id on the equipment plate after taking a very close look. It's there, but it wasn't obvious.

What made me jump to the conclusion that these were version 3 boxes was the following:

1. On the status page, they have a Linksys firmware "out of the box" of v3.03.1
2. On the Linksys support page, they have choices of v1, v1.1, v2, v2.2, and v3 versions of the WRT54G which proves a v3 hardware box is out there.
3. The documentation on the Sveasoft and other forums only mention serial numbers up to CDF5x. The boxes I have begin with serial numbers of CDF7x which I have yet to find mentioned anywhere.
4. They reject both the Satori and Alchemy firmware which my v2 box accepts with no problems.

Oh well, live and learn. ;-) I still need to figure out why Satori or Alchemy won't load on these boxes. Back to the workbench...

A.J.

517. kd5zxg: GPS and other ramblings...

Yahoo group: DAWG-HSMM
Date: 2005-02-25 02:10:27 UTC
From: Ken Peter
Topic: 496 Message: 517

Nevermind my earlier stripped down GPS board question.
Power and antenna more trouble than its worth.

Just discovered NMEA on my company issued cell phone.
Only need to find a Nextel compatible serial data cable.
Much simpler, throw my phone on the dash anyway.

And by the way, I now work for MASTEC (Direct TV).
I may have opportunities to scavenge obsolete and/or
unwanted parabolic dishes... I am upgrading dishes on
about half my jobs. We are supposed to leave the old
dish if it an off-brand. But sometimes the client will ask
us to haul the old one away anyhow, especially if it was
for an older satellite service that no longer exists.

I was also issued a Acutrac22pro finder with 2 inputs.
Only rated for use to 2200mhz. But if I am lucky, it may
stretch far enough to read 2.4Ghz? I might be able to
simultaneously view fwd and reflected power (with help
of 2 matched directional couplers, and a +5V VCO that
that covers 2300-2450 range.)

If my couplers are down -20db, would it mess up the
measurement if my meter inputs mismatch to 75ohm?
Do I really need matching pads If the swr errors at the
meter inputs are the same for both sides? Would any
significant portion of those errors be reflected back
into the 50 ohm system I am trying to measure?

I will have to put DC blocks on my meter inputs.
They may otherwise attempt to power up an LNB.
I don't want to push +18VDC to the tiny 50 ohm
terminators on the isolated port of my couplers.

My new job isn't very technical, but it pays good.
Its mostly attic crawling and roof climbing... I have
learned a whole bunch about alternate ways to
install and ground the hardware in difficult situations.
That horrible bicycle rack contaption KD5OUG and
I abused at Mentorfest, should have been a non-
penetrating roof mount. A standard piece of kit I
didn't previously know existed. Training here has
revealed a goldmine of practical wisdom.

I know you can't load Satori on the v2.2, due to the different
ethernet controller chip (Alchemy fixes this). Can't remember the
others off the top of my head.

Topic: 496 Message: 519

Sorry for the confusion. Here is the latest:

I have a v2 unit which I can flash all day long - no problems. I have not been successful in flashing with Satori 4.0G or Alchemy 6.0rc5 on two v2.2 units that I have. Both units reject the upload. I successfully flashed one v2.2 unit with ewrt-03... However, I lost ethernet connectivity after flashing. I am still able to get to the box through the wireless connection.

While searching the forums tonight, I found this on Linksysinfo.org which clears this up, somewhat:
~~~
The latest HyperWRT firmware or the Latest official linksys firmwares are the only two firmwares that are compatable with YOUR WRT54G v2.2 and WRT54GS v1.1.

DO NOT FLASH WITH ANY OTHER FIRMWARE YOU HAVE BEEN WARNED.

The new v2.2 hardware has changed the ethernet chip. Now it's a real 100mbit switcher, older versions are 34mbit really.

So if you flash with an older firmware you'll get without WAN & LAN connection, only wireless access is possible.
So you must re-flash it again with original Linksys, HyperWRT 2.0b4 or Alchemy 6.0rcX via Wireless. This is a dangerous way to do it.

You have been warned.
~~~

The version of Alchemy I have been trying is 6.0rc5 which should be working so I'm still puzzled. There must be something I am missing here. I'll give it another try and report back.

Again, sorry for any confusion.

A.J.

So, I'm confused... is there or isn't there a wrt that you can't load some incarnation of alchemy or other sveasoft firmware onto?

I have flashed a friend's v2.2 unit with alchemy, no problem. Works like a champ.

521. Other useful WRT software mods

Yahoo group: DAWG-HSMM
Date: 2005-02-25 03:20:03 UTC
From: J. Beadles
Topic: 521 Message: 521

So, while youse guys are looking at WRT software mods for APRS and maybe Telpac, I think I'll bring up some other small mods that would be really handy to have for ham use.

1. Scanning Script - The WL commands in the telnet interface allow you to do a scan of other traffic near you. I've read that the WL scan function is different than what is displayed in the status/wireless page, in that it displays rssi and noise and also all the APs around you.

To do this scan, you have to put the unit into client mode, which breaks any current client connections to the box. Then you run the scan, dump the results of the scan, and put the output back into AP mode.

Imagine you have a WRT somewhere where it is inconvenient to use the lan ports, but you want to scan the environment to look for interference sources. You command the radio into client mode, which breaks your connection and the radio is now stuck in client mode.

It would be handy to have a script that would save the state of the current connections, run the scan, dump the results into a temp file and return the radio to its' original state.

2. Timed Powerdown - My local org in particular is looking to use these units for temporary field use, probably on battery power. One three day event we would like to be able to put the radios in place overnight on batteries, shut the radio down overnight and have it turn back on the next day. That'd save a hundred milliamps and extend the battery life.

3. I think somebody else mentioned it before, but it would be really nifty to have an NTP (network time) server on the WRT, with a GPS plugged into one of the serial ports.

4. And while I'm thinking of cheezy ideas, if you had a GPS hooked up to a digipeater, you could do a really low grade differential correction on any direct packets heard within a certain range. Nah, that's too cheezy.

Congratulations on the job! Look on ebay for the nextel phone cable, I've seen their 3rd party phone stuff be really cheap. I've seen the non-penetrating roof mounts you are talking about. They look pretty useful.

A.J.

A number of people have posted to the Sveasoft forums about problems flashing Alchemy. Some of their solutions sound like witchcraft to me, but in general they say to WAIT - up to 20 minutes - after flashing to see if it works. Some have posted that if you just let the box sit there after a while the light stops flashing and it's ready to go. I haven't tried flashing Alchemy yet so I can't speak of any personal experience, but probably its worth playing the waiting game just to see if it works.

73,

Bob K5WO

From: A.J. Farmer (AJ3U)
Topic: 496 Message: 526

I got it working. I have removed the pictures from my website. They were getting a lot of hits from the Sveasoft forum and I figured I would get rid of them since they are not v.3 boxes after all.

I have only tried the web interface.

Subject: RE: [ntms-hsmm] Re: WRT54G Version 3 Hardware Pictures

I have a v2.2 that I put Alchemy on, so I know it should work. Oh, how are you doing it, via the web interface or the tfpt method? I did it successfully with the web interface, and I was told earlier that Alchemy is too big for tftp.

Will the project leaders get in touch with Rick Lindquist, N1RL@...,
concerning this project.

I mentioned this to Rick and he thinks this would make a good news item.

Thanks,

Walt/K5YFW

Can you give me a bit more context here, Walt? I assume this technology
is being used on amateur frequencies, yes? I've heard of wireless mesh
but that's about it.

Resistor divider and pullup should do it, in particular if you don't run high baud rates.

-----Original Message-----
From: aprssig-bounces@... [mailto:aprssig-bounces@...]
On Behalf Of Henk de Groot
Sent: Saturday, February 26, 2005 4:47 PM
To: aprssig@...; aprsnews@...; Remko Welling
Subject: [aprssig] DIGI_NED 0.3.5 for embedded systems

Annoucement

Available now: DIGI_NED 0.3.5 sources for use in embedded systems.

This is a stripped down version of DIGI_NED to make it easier te reuse the
DIGI_NED digipeating core in an embedded device. It contains the complete
functionional rule-based digipeater core like the full DIGI_NED has. All
additional features, like messaging, sat-tracking, telemetry, wx, serial
in-out etc are gone to make the code footprint small and targeted at the
main task: rule-based digipeating.

The source also cleaned from platform dependent code, so it doesn't use
the Linux AX.25 kernel support but instead I added a simple multiport KISS
interface. It is fully functional under LINUX, but not anymore under DOS.
Because the AX.25 kernel support is not used in this code it cleanly
compiles and runs under Cygwin.

The core source code is only 68 kB. It was a bit of work to find all the
unused support functions after deleting the additions, but I think there
is not much redundant code left, if any.

The documentation with this version has been updated to reflect the
functionality of this version and is packaged with the source. The source
is of course covered by the GNU General Public License, like the full
DIGI_NED also is.

The source has been posted to:

http://www.homepages.hetnet.nl/~pe1dnn

To use it in your embedded TNC design you must:

1: find a way to load the rule-file (changes to read_ini.c)
2: change mac_if.c to communicate with your hardware instead of the KISS code (you can then drop kiss.c and kiss.h).
3: if you want verbose output then rewrite functions "say" and "vsay".

It is still some work to make this work on an embedded system, but I think it is a lot easier to reuse this code than to use the full DIGI_NED code with all the additional features.

I hope this contribution will stimulate the creation of more powerfull TNC-digipeaters, so the network can be realy fixed...

APRS[tm] is a Trademark of Bob Bruninga,
his home page is at "http://web.usna.navy.mil/~bruninga/aprs.html"

Kind regards,

Henk.

P.S. the digi_ned.ini file is a stripped down version of the file from the full version, it has not been adjusted to the "new paradigm" yet.

P.P.S. I coded multiport KISS from specification, I have no way to test it :-). My only KISS capable device is my TH-D7E (on which it runs by the way)...

530. Richardson WiFi

Yahoo group: DAWG-HSMM
Date: 2005-02-27 04:19:39 UTC
From: Ken Peter
Topic: 496 Message: 530

Seen today's issue of "Richardson Today" paper?

City to offer free WiFi access from the Library,
City hall, Senior center, Heights and Huffines rec.
Including the parking lots and public areas outside.

Also mentions wi-fi at police and fire stations,
but wasn't clear if those will be public accessible.

First access to prompt for an email address to
send you a password. The password gets you
2hrs access (per day?)

Richardson CIO interviewed for the article was Steve Graves.
Does anyone here know him? Would he speak about his WiFi
implementaion plans for Richardson at an RWK or NTMS meeting?

I find no email address for Steve, but dug up his nextel pager link.
I don't know if this link is an appropriate way to contact him or not:
http://www.cor.net/Paging/NextelComposeMessageSteveGraves.htm

I have not yet made any unilateral attempt to initiate contact.

534. NTMS-HSMM Yahoo Group Hits 100 Members

Yahoo group: DAWG-HSMM
Date: 2005-03-01 20:45:53 UTC
From: Douglas Kilgore
Topic: 534 Message: 534

The 100th member joined the NTMS-HSMM Yahoo Group. W6QWH Charles Seevers has the honor of being #100 Sorry, Charles. We don't have any free groceries or key to a new car or anything like that. All we can offer is increased knowledge of high speed data used on the amateur microwave bands.
http://groups.yahoo.com/group/ntms-hsmm/

This group started up about 1 year ago just as a local group pursuing amateur use of 802.11b on 2.4 Ghz in the North Texas area around Dallas. Now we have subscribers from all over the United States.

Our emphasis was on adapting low cost commercial off-the-shelf equipment to amateur use. Mainly the work has been in packaging and higher gain antennas. Now a few brave souls are attempting to change hardware and the Linux firmware of the Linksys WRT54G access point to include some amateur functions.

Our first attempt to implement extended range high speed data at a public service event was the Wild Ride bike rally on May 8, 2004 The rest stops on the 62 mile route lined up in almost a straight line from the 16 story Nortel building.in Richardson. The goal was to have all rest stops and the Start/Finsh line connected to the internet and be uploading webcam pictures to a web site on a realtime basis. We only partially succeeded. It was a definite learning experience.

Our second attempt was to bring webcam pictures of the Plano Balloon Fest on Sept 19 to the web and to allow flight directors on the field access to realtime weather pictures from the National Weather Service. The area covered was only about 1000 feet from the internet gateway. We did succeed with our mission. Four webcams were operational.

Our third event was to bring high speed wireless internet into the meeting hall where the ARRL North Texas Section was holding Mentorfest on Oct. 12 in Irving. A wireless internet link was made to a computer store about 900 feet away accross a busy highway. An access point was set up inside the meeting hall. Hams were seen using their wireless PDAs to view the pictures being sent from a single webcam to a web site.

We are now planning for the 2005 Wiild Ride on May 21. We've learned a lot in the past year and hope to accomplish all of our goals for internet access.

Welcome to all of the remote Group members. Let's hear from you.

535. North Texas Microwave Society Meeting March 5th

Yahoo group: DAWG-HSMM
Date: 2005-03-02 01:54:32 UTC
From: Bob and Debbie Kmak
Topic: 535 Message: 535

This month's meeting will be at the Lockheed-Martin Recreation Center in Ft.Worth Texas.
We will be guests of the Lockheed-Martin Radio Association.

The meeting will be held in the clubhouse, Meeting Room 1 (Liberator).
As you drive up to the grounds, you will have to tell the guard that you are there for the radio club meeting.
For more info go to the NTMS web site at http://www.ntms.org/ .

The informal part of the meeting (flea market, chat) will start a 12 noon.

Then at 1 PM, the official festivities will begin:

1. "Surplus Solid State Amplifiers" by Dave Robinson, WW2R

2. Antenna Test Range, run by Kent Britain, WA5VJB.

Currently, Kent is bringing gear to test 902 MHz and 1296 MHz antennas.
If you plan to bring antennas for other bands contact Kent at WA5VJB@... and let him know.

See you Saturday!

Bob Kmak K5WO
NTMS VP

536. javAPRSSrvr Serial Port Support

Yahoo group: DAWG-HSMM
Date: 2005-03-02 15:51:16 UTC
From: AE5PL Lists
Topic: 536 Message: 536

I have added serial port support to javAPRSSrvr so the IGate and digipeater functions can communicate directly with a KISS mode TNC (no ax.25 kernel support required). It has been tested on a Linux box running the compiled form (gcj) without problem. While the size is still about 1 meg uncompressed and 350k compressed, it does provide a full APRS server, IGate, and digipeater for network appliances such as the WRT54G. I am hopeful someone will try to compile and load it on a WRT54G. If you are interested in obtaining the jar file to compile for this application, please contact me directly at pete@...

73,

Pete Loveall AE5PL

540. Y'know what this group needs?

Yahoo group: DAWG-HSMM
Date: 2005-03-07 22:21:43 UTC
From: J. Beadles
Topic: 540 Message: 540

A small and cheap 2m to 2.4GHz transverter. It occurs to me, now that the Wild Ride is coming up to us, that when you are hanging 100ft on a tower, that pointing these high gain 2.4GHz antennas is somewhat difficult. I'm still convinced (without proof) that our problem getting our 13 mi RS1 to ACoE path to work was an antenna pointing issue.

It was flat impossible to get any signal strength readings from the WAP11. All we had was a works - doesn't work from the wap. We spent 3 days (nights, actually) trying to get that path to work, and it still failed. It'll be better than that this year with the WRTs, which do give us signal strength readings, but it'll still be tricky in that the installer probably won't have a laptop up there on the tower.

I'm thinking that what we need is a 2m to 2.4GHz transverter that the installer can hook onto the antenna and use the HT signal strength reading to dial in the antenna.

Similar transverters for other freqs would probably be useful as well. Fortunately, we are a working group off the NTMS for a reason! Hey Joe, what do you think?

541. Re: [ntms-hsmm] Y'know what this group needs?

Yahoo group: DAWG-HSMM
Date: 2005-03-07 22:39:18 UTC
From: Douglas Kilgore
Topic: 540 Message: 541

Netstumbler has builtin signal strength indicator as well as a realtime graph. Just put a laptop at the base of the tower and use a HT to tell the guy on the tower to move the antenna up-down left-right.

Also if we use an amplifier on Nortel, we could use a panel antenna on the tower with less gain but larger beamwidth. The larger beamwidth would make aiming less tricky.

From: Ken Patterson
Topic: 540 Message: 543

Yeah, a simple (at least on paper) upconverter on one end & a downconverter on the other might be the trick. It "should" be very easy to get at least 200mW of 2.4GHz energy out of a 5W HT

On the other hand, if the antenna alignment will be at night again, how about using a couple of bright flashlights or similar beacons &/or strobes?

I also like AJ3U's idea of the Pocket PC & Netstumbler.

In addition, maybe the intended antennas & jumpers could be taken to the next NTMS antenna gain party, just to verify they work as advertised & intended.

de Ken,
N5EQT

Yeah, but I was trying to avoid that. I was thinking in general terms, for all events where it may not be feasible to haul up a long, lossy tx cable. Complicates the setup, too.

1. You'd have to haul the antenna and AP up.
2. Haul up the long cable to the ground, hook it to the antenna
3. Do the pointing
4. Drop the long cable
5. Hook up the access point.

On some of these long hops without an amplifier that'd put you down below the threshold of the radio, so you wouldn't hear anything.

I still like the transverter idea anyway, since the 2.4 eqpt is available cheap these days. Could do double duty as repeater links.

Ah well, a guy can dream, can't he?

Y'know, strobes isn't that much of an issue. We had visual on the end point the last time, and it didn't help pointing one of the 24db grids. Greg couldn't get his eye directly behind the feedpoint to get it that accurate.

Your right and it works very good for this purpose. I have 9 mile point to point internet connection in Kansas that I tuned using this method on my tower there for my parents to use.

Linksys WET-11 at the dish with ethernet cable to ground to Linksys AP to spray the local area at my parent home. Its been working for almost two years now.

It wasnt no fun at first carrying the notebook up the tower though. Later versions of WET-11 firmware have signal strenght indicator built into them now which now anyone on ground can help with fine tuning of the dish with out carrying notebook up the tower.

Probably be easier to use this method.....

73's

Randy, WA0D

Douglas Kilgore <douglas.kilgore@...> wrote:
Netstumbler has builtin signal strength indicator as well as a realtime graph. Just put a laptop at the base of the tower and use a HT to tell the guy on the tower to move the antenna up-down left-right.

Also if we use an amplifier on Nortel, we could use a panel antenna on the tower with less gain but larger beamwidth. The larger beamwidth would make aiming less tricky.

John,

I don't think a truly cheap 2m to 2.4GHz transverter is possible, unless you can find something on the surplus market that is easy to convert. However, a lot of hams, including myself, have 2.4GHz to 2m receive downconverters that are pretty useless now that AO-40 is kaput. These were mostly made from surplus pay TV downconverters, and were available for $50 or so when AO-40 was functional.

If you config the WAP11 to broadcast its SSID every second, there's your signal source, and with a 2m to 2.4GHz downconverter on the other end maybe that would work?

73,

Bob

Bob,

Actually, I was hoping to drag Joe into this. He and I were talking about this some weeks ago, and he is thinking that it might be possible if a really cheap VFO could be made stable enough. I think his thinking is that the widespread availability of consumer grade hardware in this band, that there need to be cheapish sources stable enough. Don't ask me, Joe's going to be the authority here.

Interesting idea about simply trying to drop the SSID beacon down to audio. I know my house AP sure gets into my 2.4 video transmitter. Hey, there's a thought....

I've found the same problem and solved it by using at least a 45 deg panel
array and BDA rather then a higher gain and sharper lobe antenna.

Yeah. Boy, I just hate to do that here, though. The amount of
802.11n activity is quite impressive, and we're pointing out into an
area that is filling in with commercial wisps. Not to mention the
fact that we're on the roof of my employer's building, right on top
of the executive's floor. We have to be a tad careful about power.

You know, I'm thinking one of the problems is just the cruddy mast
clamp on those grids. once you get the antenna clamped onto the
tower leg, it's very difficult to move it in elevation with any
precision. But we did have visual on the location. I know Greg had
it, he took a picture and showed us.

552. TNC-X update

Yahoo group: DAWG-HSMM
Date: 2005-03-08 15:05:05 UTC
From: J. Beadles
Topic: 552 Message: 552

Got my $45 TNC-X kit from John Hansen, got it built up last night. It's a Terminator 3 duration kit - which means that I watched all of Terminator 3 while putting it together. :-) Got it hooked up, ran AGWPE and started receiving APRS packets, no problem. Tonight I'll play with beaconing.

The only issues I had were getting the cabling straight, which is, of course, my own fault. Unlike the KPC-3 or other TNCs, it does not require you to turn KISS on or off, it is KISS only from the time you power it on.

Now if any of you rugged individualists get a WRT54G firmware load set up with Pete's javAPRSsvr port, I'm ready to test...

I have an Amigo PD-600C which has a built in PC Card slot (no sleeve
needed). They don't make them any more though - the company went belly-up.
I have also used a Dell Axim with a Compact Flash to PC Card adapter.

I take it you were using a pccard sleeve? I haven't seen a compact
flash card with an external antenna port.

Hmmm, I wonder what those sleeves go for these days...

Ok. A quick eBay search for iPaq sleeves puts them in the $39 range, which isn't TOO bad. Or, at least, a lot better than they were the last time I looked, which was in the $90 range.

> Hey, there's a thought....

I have a metric boat load of 2.4ghz TV down converters that we retrieved from heartland when they closed shop here in Tulsa. I'm planning on taking them (and other 75ohm and 300ohm TV doodads) to the Green Country Ham Fest in Claremore OK (http://greencountryhamfest.org) weekend after next to raise some money for our club.

I have a SSB 2.4GHz to 2M down converter (UBK-2000) that would probably work for receive. (Transmit into the thing and very bad things happen!) I also have a XMIT blocker that passes the received signal while presenting an impossibly high SWR to the transmitter.

See: http://www.sbsusa.com/modes.html to see the UEK-3000 and "The Protector" (30 watts FM and 50 watts SSB dissipation, 0.1 dB insertion loss)

Guys,

I've been able to build the Sveasoft Alchemy 6.0 load and flash it onto my v2.2 WRT54G. It seems to work and after putzing around with scp (secure copy between hosts) I've been able to copy over 500k of files to the 54G's ramdisk. So maybe space is not as much of an issue as I thought it would be. Unfortunately, the du (disk usage) and df (disk free space) commands don't seem to work with the ramdisk. du reports 0% used and 0% free, both clearly wrong. Oh well.

Now to building aprsd with the cross-compiler and then who knows what could happen. I've got the AD233BK rs-232 kit but haven't installed it yet.

73,

Bob K5WO

What's the form factor on those downconverters?

Hi I've got a couple of things I'm pondering.

1. Is learning how to design matching networks for power amplifiers (e.g. 802.11) (cheap
2. Is putting the theory together to build a phase locked VCO (cheap) Need to obtain VCO from Sirenza or another company (low qty is hard to come by)
3. I need to build a 2304 transverter anyhow. Expanding to 2400, with the design methodology I intend to use will be a no-brainer.

Hard part is getting some time in the evenings!

Joe, what's the part number on that VCO? Got a low count cost?

I dunno what prices you guys found for Sirenza VCOs...
I have a small quantity of 5V 2300-2450 ZComms that I got from
rfextra's store on ebay. $19.99 (qty4) "rfbasic at yahoo dot com"

I only need 2 of those VCOs for now. Leaving me with 2 extras.
I also have 4 more UMZ 2156-2224mhz VCO's that need a home.

>grin< I've always wondered how many units was in a metric boatload.

I believe that I have somewhere around 500 of these. We also got perhaps 1000 each of rubber coax boots, 300 ohm couplers etc. I have perhaps 50 cable converter boxes with remote controls. These look pretty rough.

There are some filters which I don't remember the range on, but I believe that they are band reject to throw out the 2.4ghz band because heartland was operating at 2.5ghz. The down converters put our 2.4ghz segment out at about channel 12-14 if I remember right. They had to be quiet from some channel (perhaps 24) down so that local, broadcast, TV worked. They require an 18v DC power source on the coax to operate. We did not get any large number of the power insertion devices. We have some, but none for sale.

I can get some digital pictures if anyone is interested. If there is enough interest, I might just EBay them.

568. 05 Hamcom HSMM Programming - Update

Yahoo group: DAWG-HSMM
Date: 2005-03-11 19:39:50 UTC
From: J. Beadles
Topic: 568 Message: 568

All,

The Hamcom web site now has a web form to collect information for presentations. Visit the Hamcom web site and click on "Presenters" on the right hand menu. Please fill out the form once for each different presentation you would like to do.

http://www.hamcom.org/

If you think you might be interested in presenting, please sign up as early as possible so that we can advertise your presentation and drive up interest.

At this time, I have the following presentations confirmed (but presenters, please still go back and fill out the form):

HSMM: Packaging for Outdoor Use - Tony Campbell W5ADC
HSMM: Using the Linksys WRT54G - John Beadles N5OOM
Intro to HSMM - John Beadles N5OOM

Gerry Creager and Brett Neilson will not be available, so we won't have them for presentations. I'd really like to have some other HSMM presentations, including an introduction to internet routing and subnetting. Anyone? Anyone?

569. 802.11b on High Altitude Balloon

Yahoo group: DAWG-HSMM
Date: 2005-03-11 23:36:55 UTC
From: Douglas Kilgore
Topic: 569 Message: 569

Keith Pugh W5IU said the Lockheed Martin Amateur Radio Club is planning for the next high altitude balloon launch. He wondered about the feasibility of putting 802.11b in the psyload. The next balloon planning meeting is Sunday afternoon Apr 3.

What equipment and power would be required? What antenna? How would tracking be done?

Who wants to pursue this?

Doug KD5OUG

Agree. One additional thing I was thinking - sometimes these things get hung on trees on recovery, which might put the circular patch facing the ground. D'you think it would be possible to put a little pin diode antenna switch on there so it could be switched to a vertical omni after it comes down?

572. A few pics from this weekend

KD5OUG and N5OOM demonstrating HSMM at the Irving Hamfest. We had some pretty good interest.

http://www.n5oom.org/hsmm/photos/kd5oug_irving_hamfest/

Pics of the NT5NT AP before mounting on top of the 260ft Nortel tower, and 10 months later.

Before:
http://www.n5oom.org/hsmm/photos/nt5nt_ap/

After:
http://www.n5oom.org/hsmm/photos/kd5oug_nt5nt/

The AP was a Linksys WAP11 in a plastic Toro sprinkler controller box. After one summer and winter cycle, the box is in good mechanical shape. The inside was clean and dry, with just a few bug parts on the floor. The outside was stained an icky brown, but the surface was not particularly crazed or deteriorated.

Thanks to Doug Kilgore KD5OUG for the pics.

A single quadrature driven patch would be leaking plenty of horizontal omni
to the sides... We aren't talking about a higly directional multi-patch
array.
I don't think its a huge issue when you allready have 500mw+500mw or
even more radiating in two othagonal polarizations..

You can easily add a vertically polarized antenna for RX diversity, but what
logic makes the decision which antenna would best transmit? A treed ballon
can not be garaunteed to be oriented any particular way. Would this PIN
diode you suggest have lower insertion loss than a mechanical relay?

Am I missing something?
I would only be concerned with 2.4 Ghz antenna
performance while in flight.

Why do we need to worry about 2.4 Ghz from the Balloon
in the tree or laying on the ground? By this point in
the mission, Recovery, we are interested in locating
the thing. A 2m beacon, perhaps with APRS Packets,
seems like a better tracking signal to me?

Just my $0.02 worth.

Not worried about tracking, obviously APRS / DF is better for this.
My thinking focused around my long past experience with model
rocketry, with rockets getting hung up on trees out of reach of any
practical tool or on private property. Being able to have the AP
running on the ground would allow you to easily extract all your pics
or data even if you aren't able to physically retrieve the payload
before the batts die.

Still, the AP would draw a lot of power, so it would be nice to be
able to command the AP on or off, maybe using the packet subsystem.
Be nice to have a telemetry module for a TNC-X.

I'm thinking about the utility of the AP for data collection after landing, assuming the payload is physically inaccessible. I like the idea of having a gain vertical for recovery data collection, since you have absolutely no guarantee that the package won't wind up in the middle of someone's deer lease in the middle of hunting season and no way to find the owner.

I can see using a high power amp during the flight, but I'm thinking that on landing you'd want to reduce power consumption after it lands so the operation of your recovery aids is prolonged. Maybe your flight logic shuts the AP and amp off on landing and you have to telecommand it back on using VHF packet or some such to extract the flight data. Flight timer or GPS altitude can cause AP to switch antennas, that's easy enough.

I can see four use cases:

1. Payload cannot be found

End of problem.

2. Payload is recovered.

Again, end of problem.

2. Payload is accessible only via RF, is on the ground, random orientation

If operators can get within range but not hear the AP, can command the payload to switch AP antennas until the AP is heard.

4. Payload is accessible only via RF, flight orientation

If the payload is sitting or hanging in flight orientation, vertical pol antenna gives best range distance performance.

My long-past experience with model rockets had the rockets hanging more or less vertically with the parachute caught under the tree. The limbs where the leaves are are often too small diameter to physically catch a payload, but are dense enough to snag the parachute and leave it hanging in the air. Certainly no guarantee, any your experiences may vary wildly from mine.

I have no real opinion for antenna switching mechanisms, I bow to your expertise. For an antenna, I was thinking of taking out the flexible printed circuit antenna out of one of the commercial 6db desktop antennas.

Just thinking out loud. None of these is a solid concern, but if you are going to put the AP on there anyway...

583. 2.4GHz mobile antenna deal

Yahoo group: DAWG-HSMM
Date: 2005-03-17 18:59:43 UTC
From: J. Beadles
Topic: 583 Message: 583

Randy Dunning KC5QHH reports that a rep from the NGC/Comet company is willing to sell these flexible whip 7.4dB gain 2.4GHz antennas for $40. They require an N connectorized mag mount, not sure if they come with the antenna. I've asked Randy to verify.

http://www.cometantenna.com/newPro_detail.php?ID=220
http://www.cometantenna.com/pdfs/sf-245spr%20spec%20sheet.pdf

Also not sure if we have to do a group purchase or can do a one at a time. I'll ask about that also.

Not to spoil the fun, but..... If the goal is simply "to see if it can be done" I give you a big attaboy, but if your looking for something practical, I can't see this being that useful. Remember, let alone the much stronger signal 802.11b needs compared to narrowband modes, your going to be on a part 15 ISM band, with a omnidirectional antenna, with a LOS radio horizon of over 300 miles diameter. In other words, your going to be competing with every Part 15 AP in that 70,000+ square mile area. So even if you could pull the link with a 24dBi on the ground end, the noise floor at the balloon is going to be the gating factor. My practical experince in warflying, is I'm getting less then 1 mile range. Much over 3000 feet AGL I simply stop seeing AP's. Now, granted, I haven't installed a outdoor antenna yet, but I don't see it helping a whole bunch. Some of the FreeWave or AeroComm/Maxstream FH 900mhz products might be a bit more robust. We ran some FreeWave's on a UAV at they seemed fairly bullet proof, but we only went out a few miles. Good luck Jeff wb8wka "J. Beadles" wrote: --- In ntms-hsmm@yahoogroups.com, dubose@t... wrote: > Aren't you going to have a little "timing" problem when the R0 gets to be more > than 26 miles away? > > Walt/K5YFW Yeah. I know this will seem like a dumb question, but why would I buy the comet antenna for $40, when http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=61816&item=5761320382&tc=photo is $15. It's a magmount all in one wire cellphone looking antenna rated at 7.5dbi. The comet is 18inches long, are we talking apples and oranges on the gains of these two antennas?

This ebay antenna was my first mobile 2.4gig antenna purchase, and I'm pretty happy with it.... of course I have nothing to compare it to!

Wes

Not dumb at all. Sometimes it's hard to second guess what other people might do. In this case, this more expensive antenna provides better mounting options. If I were going to mount it permanently on a vehicle I'd be more likely to use this on a bulkhead N mount with LMR400 coming out the bottom than the ebay special (I have one of the 5 db versions) with the short, lossy feedline. If you were going to put one on, say, the DARC club van, this'd be the way to go. Not to mention that their van roof is aluminum so the magnet won't stick.

I first thought it was rubber duck-like but after looking at Randy's more closely it is in a fiberglass radome. However, it is mounted on a spring (not part of the feedline) so that the antenna bends over if struck. So it is a little better in that regard than the fixed antennas I put on my truck before.

One thing you need to think about is where you want to launch and getting permission. We are under Class B airspace here in the DFW area and it is heavily restricted. Even outside of the class B, all of this will need to be coordinated with flight service if you have any kind of payload on it into Class E airspace (above 18K ft.) Keith ----- Original Message ----- From: "Jeff King" To: Sent: Thursday, March 17, 2005 14:44 Subject: Re: [ntms-hsmm] Re: 802.11b on High Altitude Balloon Not to spoil the fun, but..... This whole topic started when the Lockeed radio club asked if we would like to provide a package for there next Balloon launch. This will be like the 5th one if memory serves. If they do as in the past the launch occurs from the Cleburne airport early Saturday morning. In the past they have had a Cross band repeater, ATV, APRS and now have asked about a HSMM package. I think it will be an interesting experiment with lots of lessons to be learned about using these devices in a very crowded part 15 band. OK, fair enough. But you don't need to stick your hand on a stove to know you'll get burnt. I was simply pointing out that a wideband radio, on the most popular ISM band, in a dense urban area, would have quite a wide radio horizon, and hence, a high noise floor. If your dead set on lofting a Part 15 radio, I'd pick a more robust one then a 802.11b link. The FreeWave units I mentioned, they are frequency hopping 900mhz units, putting out one watt. One of those, with a turnstyle antenna on the balloon, with a PC104 embedded Linux webserver/webcam would make a really cool platform. With 115kbps throughput, you should be able to serve up images to a ground based server, and allow the general public to access the balloon via HTTP (the images being mirrored on the ground based server). Use your low data rate 2m APRS to send positional reports, and use those to aim your ground based high gain 900mhz array toward the balloon. I've used two of these on remote projects, one as I earlier metioned, a UofM UAV that used a PC104 computer running QNX, and the other for the UofM sun racer electric car. Both worked quite well. That much being said, thinking about your interest in 802.11b, you might be able to get it to work anyways, thinking about the physics of it. The real issue is the radio RECIEVE horizon of airborne station. No way you can get around this and it is not (that) practical to have a directional antenna on a balloon. The solution to this might be lets say a 30db gain dish (they do make these) and couple that with a 10 watt or so amp for the ground station. The idea being here, is you need to get over the high noise floor the balloon is going to be hearing at altitude. Still think a set of FreeWaves is a better ISM band choice, but the above might be able to get you out 10-20 miles. But don't forget, 100,000 feet is almost 20 miles, let alone the slant range. Anyway you cut it, I think you'll be disappointed with 802.11b on a balloon. Ron Cole wrote: This whole topic started when the Lockeed radio club asked if we would like to provide a package for there next Balloon launch. This will be like the 5th one if memory serves. 590. WIFI Access Point Question.

Yahoo group: DAWG-HSMM
Date: 2005-03-21 18:57:26 UTC
From: Jerry Karlovich
Topic: 590 Message: 590

I know this is a departure from the "hobby" type posts but I want to install a wireless access point here in the office for my own portability and also for clients to use. Before I go out and start spending doe I would like to know exactly what I need. Right now I have a highspeed Comcast cable modem/router and coming off that a Linksys switch giving me 8 ports to connect the "closed circuit" LAN. I want to add a WAP that will give connectivity to the web but not the LAN. Makes sense? Without having to add another IP address from Comcast.

Open for suggestions.

Jerry KD5OM

591. WiFi card suggestions?

Yahoo group: DAWG-HSMM
Date: 2005-03-21 20:52:28 UTC
From: inmyear2000
Topic: 591 Message: 591

I'm running an older laptop (P3/366) and looking for suggestions for a PCMCIA or Cardbus card to add WiFi. Specifically, for a card that works on b/g or even better a/b/g. Has a good reputation and maximum power/performance. And, is known to be friendly for an external antenna addition for ham use.

Oh, not a zillion dollars, either.<G>

Anyone have suggestions pro/con? It would be nice to find one that could live in my card slot without breaking off the external antenna portion if I put the whole computer "as is" into a bag. And it has to run under NT5 and XP without suspend/hibernate problems.

So there's a "right" answer, and a simple/cheap answer, depending on your budget, skill level with IP routing/firewalilng, and desired investment in time.

I'm making the following assumptions here:

1. Your cable service terminates in some sort of Comcast modem.
2. You have a NAT router (DLink, Linksys, Brand-X) plugged into the modem.
3. Your computers are plugged into the NAT router (or possibly into a hub/switch, which is in turn plugged into the NAT router).

If that's correct, the "right" solution would be to replace the NAT router with a "real" router (meaning maybe a cheap Cisco 25xx you can get on EBay for next to nothing, or a Linux or FreeBSD box set up for firewalling and routing). This option requires a bit of $$$ and a bit of skill (though not huge amounts of either), but will yield the best (where best == "cleanest, most secure") result.

On the other hand, if you just simply want it to work "right now" and good enough is good enough, you can do the following:

1. Go buy the cheapest NAT router you can find (DLink, Linksys, Brand-X).
2. Unplug all of your PCs from the existing NAT router.
3. Plug your Wireless Access Point into the existing NAT router.
4. Plug the "upstream" side of your new NAT router into one of the ports on your existing NAT router where there used to be a PC plugged in.
5. Plug all of your PCs into the new NAT router.

Note that there are a number of potential "gotchas" with this setup, but unless the IP address ranges given out by the two NAT routers overlap, it *should* work for most home use applications. If the address ranges overlap, just change one of them (ie, if they are both 10.0.0.0/24, change one of them to maybe 192.168.0.0/24). You'll have higher latency (higher ping times) and a few other oddnesses, but the second (new) NAT router should serve to keep your wireless clients out of your wired machines (though not the other way around).

Note that the cheap/simple solution should work even if I made the wrong assumption about the modem and router being separate boxes.

Thanks for the reply. My Modem/Router by Comcast is the same box. In case your not from around Plano, TX, that's the local cable provider. That box only has 4 spigots but I need 6 so I added the switch and all the office PCs plug into the switch. With 2 additional un-used spigots that terminate in my front lobby area and the other in the conference room. This is so I could tote my laptop to those areas. However, I was wanting to be totally wireless around the office and prevent possible hackers into the LAN. Although I will probably enable the WEP to give a little more protection.

On a side note, I am picking up an open "LINKSYS" access point from somewhere around here. It's very weak but there. You would think who-ever installed those would WEP'd them. Brainless.

Without changing out my Comcast provided Modem/Router what would you do?

Brainless? What ever happened to the spirit of amateur radio? My WAP at home is on the outside of the home LAN so I leave it open for that specific purpose. Friends with laptops know it, and use it. One of our radio sites (www.ocrg.org <http://www.ocrg.org/>) is under forest service control but has lots of guests, campers, and hams for contesting purposes. We have a 18 mile shot on 2.4Ghz to get a T1 up there for video security, echolink, etc. and again, outside of our LAN we have a wireless router we leave open for folks camping on the hill or just visiting to use.

While I understand your assumption that open WAP's are so because the owner doesn't know better, that isn't always the case.

From: Joe Jurecka
Topic: 595 Message: 595

Hi,
I think WiFi on a balloon is a workable endeavor. Realize that 99+% of the units that it will "hear" will have low gain dipole grade antennas which don't do a whole lot of good on 802.11. Us hams with the 24dB grids will have a substantial advantage....plus....with some of the BDAs, it should make comms a slam dunk.

My point is don't be afraid to try it out....you never know how pleased you might be until you try!
Joe

596. Re: [ntms-hsmm] Wifi on balloon

We have received an invitation to attend the Apr 3 2:00pm North Texas Balloon Project coordination session at the Lockheed Martin ARC facilities in Ft. Worth. Since I will be out of town for 8 weeks this summer on vacation, we need someone to step forward to be HSMM project leader on this.

I have a Engenius CB3+ Deluxe 200mW +23dbm access point that can be used for this project (after the May 21 Wild Ride). It has a 3db greater receive sensitivity than most APs.

For an antenna, we could use one of Kent Britain's horizontally polarized circuit board antennas.

It would be nice to attach one of those LIGHTWEIGHT IP cameras. I have a D-link DSC-900 but I will be taking it with me on vacation.. Does anyone else have a camera that could be used?

Who wants to take on this project?

Jerry,

I'd be using WPA if you can humanly do it. WEP is crackable in a matter of minutes these days. It is true that 2/3 of all the access points surveyed had no security enabled, and it is also likely that somebody wanting access will use an unprotected access point. However, it'd be unpleasant to be the target of a script kiddie who happened to have a WEP cracking script loaded.

The only issue with using WPA is that you need to make sure that both your AP and card were both able to handle it. The last time I checked, there were no plans to provide a WPA capable driver for my old Orinoco card.

Having an a/b/g card with an antenna port is a killer. I don't think I've seen any like that.

The old Orinoco cards have antenna ports, but they are relatively low power and not all that sensitive.

Currently, the best liked seem to be the high power SMC cards and the Senao/Engenius cards, both of which put out abt 200mw. SMC and Senao have cards with antenna connectors and with non-removable antennas, so be careful what you get. SMC is available in some stores, while I've only seen people buying Senao on the web.

Yes, I meant BRAINLESS!!

Is this the spirit of amateur radio?;
http://securityfocus.com/news/10138

I could of sworn that I was clear in saying I am refering to a wifi
at a business. It was brainless for the I.T. person there at the
place of business in the above mentioned news story to have not
secured those networks. Yes brainless.

600. Thoughts on HSMM WiFi Network Security

Yahoo group: DAWG-HSMM
Date: 2005-03-22 18:37:02 UTC
From: J. Beadles
Topic: 600 Message: 600

I've been throwing the idea around of using HSMM as a metropolitan area network, something to use to tie Echolink / IRLP /APRS /Winlink nodes together and to tie them to geographically redundant internet feeds. But the security issue has been a problem.

As we all know, under part 97 we can't run encryption to deny access to the content of the traffic, period. But this is the heart of wireless network security these days. The current trends of internet abuse seem to be hackers putting spyware and robots on thousands of individuals' computers for the purpose of doing identity theft and targeting spam.

With most users' Wifi networks being unsecured, it'd be relatively simple manner for a hacker to drive down a street, letting his computer momentarily connect to each unsecured (or easily crackable) network, dropping off a perilous payload on each network. This would be an easy way of avoiding the front end firewalls that users are putting in place.

Before poo-pooing this idea, understand that this has been done before with analog cell phone networks. In the analog days, it was easy to park next to a freeway with some scanner gear and steal the AMPS phone sids from every cell phone connection the equipment heard. These IDs were then resold. Mine was stolen in just this way.

So what does that mean for an amateur HSMM network based on WiFi equipment? Obviously it means that such a network is very vulnerable to abuse in the long term. I'm thinking that the answer to this is not to shy away from using the technology, but rather to treat the wireless network just as you'd treat the public internet. That is, the wireless interface wouldn't be connected directly to anybody's network, but rather to the WAN port of a router, so that the wireless network is firewalled just like the public internet.

We have only rudimentary methods available to us to keep unlicensed users off our network. We say that this, at least, makes the unlicensed user take a positive action to get into our network, just like we can't keep somebody from buying an HT and accessing a repeater with a fake call sign. An unlicensed person on a 2m repeater; however, can't do actual damage, where a network hacker can. It strikes me that the best way to prevent this is to firewall our own networks, just in case.

Comments?

Hi John,

Good seeing ya'll last night at the meet'n.

Wouldn't you know it, that's what I have, an old Orinoco 802.11g card with the little mag mount antenna that plugs into it. I guess what I can do is put in a WAP and set it's antenna so that it only provides service here in the office and it doesn't radiate much furthur than the front door. WEP'd of coarse. My modem is in the center of the office and the office is small. I figure if I'm picking up a feed from the Holiday Inn about a 1,000 feet away I can get through a wall into the next room.

I'll try that this weekend.

Take care,

Jerry KD5OM

No expertise. Only suggesting a relay might be less lossy than PIN
diodes if you aren't needing it to do any fast switching. Whatever
happened to all that MEMS switch hoopla? Did any reasonable cost
real world parts ever come of that?

I hope you don't mean a commercial 6db patch? Unless you know
of one thats a true circular polarized... The balloon will be turning
and possibly right above you or drifting, no linear polarized antenna
on a baloon would garauntee you can always hit it the right way.

I suppose you could try polarization diversity, but then you are
back to lossy fast PIN switches.

Cascade two firewalls. Keep your wireless intrusion concerns on the outside your private LAN. VPN in if you need that functionality.

Internet<>CableModem<>WirelessFirewall<>WiredFirewall<>Switch

Assign your Wireless network a different subnet from your wired one. Wireless might be 192.168.0.X , Wired might be 192.168.1.X

er... sounds like the same suggestion I just gave.

I might point out that neither of our proposed firewall cascade schemes
does anything to keep the wired network's routed NAT/PAT internet traffic
from broadcasting on the wireless side. We may stop straightforward
intrusion
into the protected LAN, but still presents a target for wireless snooping.

Is it possible to exclude the MAC address of the downstream firewall's WAN
adapter from broadcasting on the Wireless?

Welcome aboard Jory. As you can see from the archives, discussion has
been ongoing about putting 802.11b on the balloon.

Please share with us information about the balloon packages.

I agree that a CP Antenna would be preferred.
This would eliminate all of the Commercial 2.4 Ghz
antennas I have seen.

609. HSMMing in the Clouds

Yahoo group: DAWG-HSMM
Date: 2005-03-23 16:55:24 UTC
From: Jory McIntosh
Topic: 609 Message: 609

Greetings. I am the package coordinator for the North Texas Balloon Project. Its my job to determine what equipment will fly in the packages, verify that their weight falls with the required limits and that their size, antenna, and power requirements are within specified tolerances. Finally on launch day I have to perform prelaunch testing of the equipment, and verify the equipment is functioning at launch. Its a busy job, but a lot of fun. .

I have heard rumors, now confirmed, that the HSMM group was looking into launching an 802.11 access point on a balloon and performing network operation through it. The Lockheed group has considered launching an AP on a launch but felt that we lacked the expertise to successfully accomplish this task. Many of our group run wireless APs at home, some of us including myself have built antennas and done various other modifications to our equipment to increase range and connectivity. However, using an AP at 90,000 feet is a totally different matter. :)

To give you an idea of what environment an AP would be operating in, let me give you a run down on the balloon and all its goodies. Our balloon is a standard weather balloon that we fill with helium up to a lifting value of between 13 and 16 lifting pounds. This value can vary based on the amount of time we want the balloon to stay aloft, and where we want it to land. Below the balloon is a parachute that has been designed to allow a slow decent of a 12 pound weight.

The first package is below the parachute. It contains the APRS, GPS, and the 2m DF beacon, this package is called the "Shuttle". The second package, the "Comm" package, contains the 2m/440 cross-band repeater, and any other special items we want to send up. The third package, "Experimental" package, contains experiments we want to fly. For the September flight the experimental package is being setup by the Bonham club. The fourth package is the "ATV" package, and contains a 1.2 Ghz ATV transmitter.

Ok so that's the balloon, now let's talk about the restrictions as they pertain to the payload.. Federal Aviation Regulations (FAR) part 101 cover the rules for unmanned free balloons. To stay within FAR regulations the entire payload must be less than or equal to 12 pounds. As well the tethers and other items must be able to break and not impose a threat to an aircraft that happens to impact the balloon. In other words we can't put a 45 element beam on the package. :)

Onward to power. Each package has the option of using a lithium battery pack, that normally operates at 12 volts, and has a capacity of 3 amp-hours and weigh of around 2 pounds. These are actually made up of

several lithium cells that run at 3.2 volts, so we can support multiples of cells up to the 12 volt level if we fly equipment that requires less then 12 volts. We use lithium because the output of other battery types decrease as they get cold, and tempatures of -40 F is not unexpected during the flight.

As to antennas, all our antennas are on the out side of the package. For the last few flights we have been using dipoles for the cross-band and APRS. How ever in the past we have used rubber ducks. So your kinda free to use any antennas you want as long as they meet FAR requirements, we have a place on the outside of the package for it, and they don't create interference to other equipment or the balloon tethers on the flight.

So I think the big question is, is there room on the next flight for a HSMM unit? Well there is an empty space in the cross-band package. This package is still being designed but will look like the Apollo capsule when completed. It will have a circumference of about 8 inches and a height of about 10 inches give or take. Currently the cross-band setup is being rebuilt and will use two Alinco credit card radios and a repeater controller. Neither will use a Lithium power pack. So it sounds like we have a space of about six inches wide by four inches long by five inches tall that is free.

How about weight? Well we are early in the game here, but the estimates of the shuttle package are around 4 lbs, the cross band will be 2 lbs, and Doug I think you said your package would be about 3 lbs right? So that's 9 lbs. To be on the safe side, I would say we have between 2 and 3lbs to spare. I am currently not sure that the ATV package is flying this time so that weight is not considered here.

So here are the requirements you should meet to be considered on the flight. All instruments take up less space then six inches wide by four inches long by five inches tall, use 3lbs or less including battery, antenna on the outside of the capsule that meet FAR regulations, will not interfere with the balloon tethers, nor any other equipment, and all equipment can operate at 12 or less volts.

Here are some other considerations. Your equipment could be exposed to -40 F in tempature. In the past we have used hand warmers to keep the equipment warm, but we found that since the package is made of stryofoam the equipment got too hot, so expect your equipment to get very cold. Also you only have 3 amp-hours of power budget, once its gone, your off the air. At 90,000 feet our cross band repeater can easily work into Mississippi, Kansas, New Mexico, and out into the Gulf with 1/2 a watt. Something to consider even with a part 15 device, you'll cover a lot of territory. Finally we did have a tether break on one flight and a package free fell from 73,000 feet. At impact the terminal velocity was calculated at 37 mph. The package was in bad shape but the equipment survived. Just something to keep in mind.

I am very excited about the possibility of flying a 802.11 device on the balloon. I hear that the record for a 802.11 connection is 67 miles, would be interesting to break that, and a good item for QST! I am willing to work with your group to help design a system that is flyable on the balloon. I'll also talk with the balloon committee about the idea, get their input, and see if we can get the weight and power requirements for the next flight nailed down to make things easier for you in designing a system. Please let me know if you would like to fly a 802.11 system on our package during our next launch in September or a future launch.

Okedoke. I haven't looked at PIN diodes for 10 years, so you would
know better than I would. Relay is fine.

Nah, not for this app. Go back and reread some of the past msgs.
You can use CP on the bottom of the package for flight access, but I
want a gain omni out the top of the package for post-flight data
collection.

number?

I found an IBM a/b/g card clearanced, WPA and WEP and more, and for $25 I'm
willing to open the case and see about adding an antenna. At least it will
get me started.<G>

613. WRT54G Project - Status Report?

Yahoo group: DAWG-HSMM
Date: 2005-03-25 14:50:52 UTC
From: J. Beadles
Topic: 613 Message: 613

Time for a status report... From y'all that is. First, who is working on the WRT54G project? This, for those people joining, is a project to use a Linksys WRT54G 802.11G router to control a KISS based TNC. This would be useful for cheap, configurable APRS digipeaters and Telpac gateways for use with Winlink 2000.

This is possible to do because the WRT54G is built on a Broadcom reference chipset that includes hardware support for two onboard serial ports. These serial ports are accessible by soldering a 10 pin header on the circuit board.

For the most part, we are using the 3rd party firmware source from Sveasoft (www.sveasoft.com) to build the firmware load for the WRT54G. There are several other routers by different manufacturers that use the same chipset and can be used in this way.

At this time, I know of the following activity:

1. Pete Loveall AE5PL, keeper of the JavAPRSsvr software, has compressed a JavAPRSsvr package small enough to possibly

2. Bob Kmak K5WO has been teaching himself how to build the Sveasoft loads.

3. A. J. Farmer AJ3U I know has been experimenting with the Sveasoft loads.

4. I've completed the serial port adapter and a TNC-X and am waiting for a firmware load.

Who else has been actively pursuing this project, and what progress have you had?

614. Airlink 8dbi Directional Antenna on Sale at Fry's

Yahoo group: DAWG-HSMM
Date: 2005-03-26 16:04:51 UTC
From: Douglas Kilgore
Topic: 614 Message: 614

Fry's in Dallas area has on sale an Airlink 8dbi directional antenna for $4.99. It's for Reverse SMA but includes a TNC adapter. This unit should work with the Hawking 500mw amplifier some of us bought.

http://shop2.outpost.com/product/4278424?site=sr:SEARCH:MAIN_RSLT_PG

Sale good thru Tuesday.

Doug KD5OUG

617. PCMCIA card choices for external antenna?

Yahoo group: DAWG-HSMM
Date: 2005-03-29 23:18:30 UTC
From: KC2MMi
Topic: 617 Message: 617

I've tried to do my research & would appreciate a reality check. It seems like the only pc cards that are equipped for an external antenna are the Orinoco "Classic", similar Proxim models, and the Enterasys clones of them. And the Enterasys may be the only a/b/g combo with an external antenna connection.

Is that about right?

618. Re: [ntms-hsmm] PCMCIA card choices for external antenna?

Yahoo group: DAWG-HSMM
Date: 2005-03-30 00:10:23 UTC
From: Keith Berry
Topic: 617 Message: 618

There are multiple 'clones' of the Orinoco Silver or Gord with external connectors on them. Included are 2Wire, Lucent, Proxim, Avaya. Some Senao cards also have external connectors.

Depnding on your connection needs, yuo might be able to just use USB adapter to get you the extra gain needed.

73,
Keith KE0FV

Close, but not quite, at least for b/g cards. Some of SMC's high power cards have detachable antennas with RP-MMCX connectors, and Senao has cards with both fixed antennas, and only antenna connectors. Also, some of the fixed APs on the market actually contain a card with an antenna connector. Here's a good research site:

http://www.seattlewireless.net/index.cgi/HardwareComparison

There's many more than that, albeit the choices are not great :)

Cisco's LMC-352, being a more costly card has MMCX jacks, 100mw of power and the highest receive sensitivity of any of the cards I've tested, and it's B only (still the best for 11 meg).

Another good card is the SMC Elite Connect card, with RP-MMCX jacks, 200mw of power, again only B, but another good card. Other import variations are available with the same chipset by Senao and a few other OEM's that label them with their name.

The Proxim Classic gold as a B card has the MC connector, and the Proxim Gold B/G card has the MC connector as well. These are the only two I am aware of that are current production models in their non-enterprise grade gear that has the connectors on it.

Cards with A/B/G are very difficult to find, the FCC cracked down on allowing type acceptance of the 5.3ghz band cards with respect to external antenna connectors after looking at what happened with the 2.4 ISM band. They wanted "non standardized" connectors, which by all rights are not really non standard when 10 factories in the orient are churning the connectors out by the thousands :) So they basically tightened up the guidelines that a product will get accepted for with A restrict manufactures from doing much with it.

Cisco -has- a A/B/G PCI card that has a small 2.2dBi antenna on 4 feet of RG174 that can -easily- be converted to use a different antenna, I use a couple of these on SBC's I have a few rooftop bridges in, and they work well in congested 2.4 areas.

Unfortunately, with the tighter restrictions on the 5ghz radios type acceptance regarding external antenna ports, it not only has stunted the growth of the A standard, but pretty much prevented it from ever getting started.

From: Dave Anderson
Topic: 619 Message: 622

Most likely, yes.

The lionshare of these cards use what is referred to as a Hirosi U.FL connector to connect to the internal antenna around the screen of most laptops.

If you do have this, pigtails of 6 and 12 inch are available that will connect with 2mm cable (very very small teflon cable) to a RPSMA femail bulkhead, SMA female bulkhead, or Nfemale bulkhead in the case of the one I use.

Subject: [ntms-hsmm] internal wireless card and external antenna

All,
I have a Toshiba M25X-S149 laptop with internal
wireless card.

Is there anyway to add an external antenna to an
internal wireless card such as this?

Thanks.

Rusty

Rusty,

Some of them are under a cover on the bottom of the laptop, similar to the type of cover you'd find over the memory slots.

Some of them put the mini PCI slot under the keyboard. How that comes out varies with notebooks, some a piece of trim snaps in holding the keyboard in place, some have screws in the back (such as dell's) that hold the keyboard in place, and some have clips that are spring loaded that hold the keyboard in place.

Either location, once you fine the mini PCI card you'll fine the two very small antenna cables plugged into the card.

You know I have read about putting USB 802.11 adapters on satellite dishes!!
One fellow in my town couldn't get into his house from laptop in shed, so he
got a USB 802.11 dongle and a USB a-a extension cable, mounted the USB critter
in a plastic box outside the shed, and it worked like a champ....

See http://www.kd4rdb.com/bbs/viewtopic.php?t=74 for neat info...

Maybe! I didn't know it until recently, but my work laptop has, for the past 3 yrs, had a mini-PCI socket in the bottom with some teeny tiny antenna connectors already wired into the laptop. Had I known, I'd have taken advantage of them. I can't remember off the top of my head what those connectors are called.

Now, the question becomes, is there a convenient way of routing external antenna cabling out of your laptop?

Keith, how does a USB adapter gain me anything over a pc card? Are they simply more powerful, or just more likely to use external antenna connectors? (And available a/b/g ??) I've got enough gain at home, but want to look into pushing it to the max for field operations as a data relay.

John-
Great URL. From their table it looks like the Orinoco combo and Engenius/Senao are the best choices, with the latter offering higher optional power levels> Or maybe I'm misreading their power spec, and the range of power levels it gives refers to different levels per each service type? Any disadvantages to them? I notice the Seattle folks don't list rx sensitivity on anything. And surprisingly, that 11.a-only cards offer much higher (double+) tx power compared to the combos. Very interesting site!

Dave-
Ah, so the 11.a with external antenna still exist from OLD cards...Makes me think I should consider a triple card for my own computing use plus a b/g only for ham use, sometimes getting everything in one device just isn't feasible. (Duh.<G>) I'd still like to use 11.a for my home use in the belief that most of the neighbors won't think or know about 11.a and that adds an extra layer of security. Cisco stuff often works as advertised.<G>

Thanks one and all, that gives me a lot to work with!

Have now found out the new b/g home gateway supplied by Verizon (a Westell 327W) is advertised as WPA and SPI capable--but doesn't have any option to use either. Probably looking for a triple mode home dsl gateway now too. (Bummer!) The guys at Verizon DSL....must be hard having a job where the cash register buttons don't have little pictures on them.

For instance, the Linksys USB adapter antenna has a
better gain that the built-in card antenna and can be
strategically placed to get the best signal. There
also is no loss in the USB cable and they can be ran
quite a distance from the PC. Thee is also the option
of the 'Poor Man's WiFi' method listed at
http://www.usbwifi.orcon.net.nz/. They have used the
small 'thumb drive' size adapters with woks, frying
ladles and such for parabolic reflectors. Pretty
ingenious of them to use it. Again, no loss in the
USB cable for temporary portable use.

73,
Keith

629. a/b/g choices

Yahoo group: DAWG-HSMM
Date: 2005-03-30 22:58:01 UTC
From: KC2MMi
Topic: 629 Message: 629

I think I'm down to a choice of two cards. An Enterasys CSIBD-AA-128 a/b/g, or a Proxim Orinoco 802.11a/b/g Gold Combo card.

Both about the same price. If you guys had to flip a quarter and then spend it on only one card <G> would you favor the one or the other?

Second question, Verizon lied about the gateway router they were supplying. They say it supports WPA and SPI, but it doesn't. Ooops. So when I ship it back, I'm looking to replace it with a dsl gateway router with a/b/g as well. I've found a DLink AirPremier DI-784 for about $100 and an SMC EZ-Stream SMC2304WBR-AG for nearly twice that. The SMC has SPI, the DLink doesn't.

Flipping that same quarter...from what I've heard the DLink receivers aren't so hot, and SMC builds a better box. Is that right? Any better contenders?

The wallet's open, the order has to be placed. What say you all?

And don't forget that you can sometimes add a simple corner reflector and
gain 6-10 dB of gain over about a 45 degree sector.

At 01:20 PM 3/30/2005, you wrote:

Well, in Germany a group of HAM's have it running on a LinkSys WRT54GS V1.0 wireless modem and showed it at the 21st Packet Radio conference in Darmstadt, Germany, which was held on April 2nd, 2005.

This type of modem runs Linux and is available in Europe for about EUR 75.- and about $60.- in the US.

The group is working on instructions, I've seen a sneak preview and it will be simple!

They currently run the embedded version but I think it could just as well run the full version with the new KISS interface.

Besides DIGI_NED they also have TNN, Wampes and XNET running. I guess when the information is official a link will be posted to the APRSSIG.

Kind regards,

Henk.

John,

Other stuff has kept me from working on aprsd for close to 2 weeks. Where I left it, I was able to compile the code with the mipsel cross-compiler but was getting link errors, with the linker squawking about no support for wide characters in ulibc, the runtime libraries that are used to build the Linksys and Sveasoft loads for the WRT54G.

I'm not sure why aprsd needs wide (16 bit) character support, and it could just be a matter of the compile and link options I'm using when doing the build. Anyway, I should be able to get back to it in the next few days, and hope to have some good news next week.

73,

Bob K5WO

Yet another case of co-incident development. We'll have to see what
they've got. I'll get in touch with Henk. Thanks Wes!

Howdy Bob,

Good progress being made. I certainly understand about having to cover other stuff (especially non-ham stuff). Personally, I've had to take a few "mental health" breaks in the past few weeks.

I'd say keep going, this news about the german group's success notwithstanding. I'm thinking that there may still be other things we'll want to add, and once a linux version of telpac is available we'll want to add that too.

'Tis no coincidence!!! I asked Henk to help us a couple of months ago off sig.... Offered to send him a router, which he declined. What he did do was to strip down digi_ned and remove the ax.25 stack leaving only the KISS interface stuff....

Wes

639. 05 Wild Ride Network

Yahoo group: DAWG-HSMM
Date: 2005-04-11 18:09:21 UTC
From: J. Beadles
Topic: 639 Message: 639

Here's some first comments on HSMM concepts for the 05 Wild Ride network. This event is a 65 mi charity bike rally run in conjunction with the city's Wildflower Festival. The goal of the HSMM exercise is to get experience with operational HSMM bridge deployments. We'll be deploying web cams at the stops along the route, feeding a central web site.

1. The rest stops are mostly the same as next year, in a line to the ENE from the 16 story Nortel tower at Central Expressway and Campbell road in Richardson, TX.

2. It looks as though we will get another internet feed from the City of Richardson. This feed will come off the Eiseman Auditorium. Eiseman is approx. 1/2 mi north of the Nortel tower. The start/stop is on the parking lot of the MCI engineering headquarters bldg, 1/2 mi east of the Nortel tower. The direct path is blocked by Nortel buildings. The plan is to bridge the internet connection from the Eiseman center to the Start / Stop area via an access point on the Nortel tower.

What I intend to do is to use a WRT54g on the Nortel tower with gain omni antennas (Gerry, hold on a minute before you say anything), with the antennas tilted so that the plane of radiation is at about a 45 degree downtilt crossing both the Eiseman center and the Start/Stop. We can adjust the power so that we don't over-radiate the outside area. This also means that the residential areas to the west of the bldg will be sheilded by the Nortel bldg and that the antenna pattern will be tilted up into space by 45 degrees. This should reduce any unintentional interference to neighboring systems. Comments on this plan are welcome (Ok Gerry, now you can comment).

Last year this bridged connection was unsuccessful. We were using 3 WAP11s on a single ethernet switch, which did not want to work for some reason we have never been able to establish. This year we'll use two WRT54Gs, which have already been tested to work in this configuration.

3. Rest stop 1 is in the same location as last year, which is a new residential development area in Wiley, TX. Last year Doug KD5OUG convinced the developer to let him put an access point on their office network, which covered the area. Doug is looking into this year's system, but it should be similar.

4. Rest stop 2 is on the east bank of the Lake Lavon dam road, same as last year. The plan is to again attempt a 13 mile bridged shot from the Nortel tower to the Army Corps of Engineers tower (150 ft max

AGL), then hop the 2 miles to the rest stop. This rest stop is in a rural area, isolated from other services, so this is really the only way to the location. We'll be using two WRT54Gs in WDS bridge mode, one back to the Nortel tower, the other toward the rest stop. We may also have a web cam pointing down the dam road.

Last year this hop was unsuccessful. We were using WAP11 access points and 40 dB of total antenna gain for the bridge and could not establish a connection from the ACoE tower to the Nortel bldg. This year we'll use WRTs and 48 dB of total antenna gain (two 24 dB grids). We'll also start much earlier, giving us a much better chance of completing the path in time.

If we are able to get a WRT/APRS box install completed in time, I'd like to put a relay digi, just to test the concept.

3. Rest stop 3, I think is in the same place at the Community High School in rural Josephine, TX. This is 8 miles NE from the Army Corps of Engineers tower at Lake Lavon. Last year we attempted to shoot a bridge shot from the tower to the site. This year, we are hoping to use the DirectWay satellite installation one local ham has on his RV.

4. Rest stop 4, If I have this right, will be located near Renner Road and Murphy Road in Richardson. This is on the order of 6 miles from the Nortel tower, but residential development will not permit a direct connection. I don't know what we will do with this one. We are near a Richardson Fire Station, which are now supplying a limited duration 802.11b connection, but it is on the other side of the residential development also.

641. Re: 05 Wild Ride Network

Yahoo group: DAWG-HSMM
Date: 2005-04-12 20:08:02 UTC
From: J. Beadles
Topic: 639 Message: 641

FYI, yesterday the NT5NT APs were installed on the roof of the Nortel bldg. Two WRT54G APs were placed, both on the roof at about 260 ft agl. The roof has a 20ft tall aluminum surround wall enclosing the elevator and AC units.

NT5NT-3AP, with a pair of 5dB omni antennas was placed on an I-beam behind the shield wall, with the antennas poking down through an opening in the shield wall. This position has a clear view of the MCI bldg (event start / stop) to the east and the Eiseman Auditorium (internet feed) to the north. The location also screens the system from users outside that arc and within the 1st 100 yards closest to the bldg.

TX power is expected to stay in the 28mw range to minimize interference to the 802.11b users on the floor below. Testing with a bare Orinoco card indicated signal in the -85 to -90 range in front of the Eiseman center and at the corner of Greenville and Glenville. No signal was seen outside of these areas. Signal testing using the WRTs wl scan function showed no visible signals outside of the Nortel access points on the floor below.

NT5NT-4AP, with a 24dB grid antenna was installed facing the Army Corps of Engineers tower at Lake Lavon. This antenna and AP is mounted on top of the shield wall in the north corner of the bldg, facing NE. The antenna is definitley visible from the ground in the morning sun!!! The antenna is set for horizontal polarization.

TX power is expected to stay at 28mw to minimize interference to 802.11b users on the floor below. Testing with a bare Orinoco card indicated only a few extremely low power measurements at the ground within the 1st half mile (no other testing was done). Signal testing using the WRTs wl scan function showed no visible signals, period.

Both APs are connected via Power over Ethernet connections to a junction box (thanks to W5ADC) mounted on the shield wall on the roof. Both are connected together through a Dlink 5 port ethernet switch. All units are powered with 12v from a 48v to 12v DC-DC converter in the junction box. 48v is supplied from a power supply in a 16th floor electrical room. There is no data connection off the roof. A wireless connection was made to the NT5NT-3AP, with wired connectivity then demonstrated to the NT5NT-4AP admin interface.

642. Bad News for APRSD

Yahoo group: DAWG-HSMM
Date: 2005-04-20 02:26:42 UTC
From: Bob and Debbie Kmak
Topic: 642 Message: 642

Guys,

Well I managed to build the aprsd program for the Linksys WRT54G, but can't get it to run. The problem is that the C++ runtime library is not included with the Linksys/Sveasoft load. Now that I know it, I'm wondering why I didn't think of this before. But the fact is that both Linux and all the Linksys router software are written in C, and only the C runtime stuff is included in the WRT54G load. The C++ library is large -- 4.5 Mb -- so I can see why they left it out.

I copied the library (libstdc++.so) to the WRT54G ramdisk and set the LD_LIBRARY_PATH to the local directory -- to make the Linux loader look in the right place -- still no joy.

So I'm thinking this aprsd project of mine is pretty much a lost cause. I'll fiddle around with it a bit more but don't feel optimistic right now. I guess I'll find something else to port.

73,

Bob K5WO

Bob,
Have you tried linking 'aprsd' statically so that you're not dependent
upon a huge .so file? It might be that only a small portion of that .so
is needed to make the critter run. Now, this will make the executable
larger but depending on how much of the standard C++ library you needed
will determine how much bigger. Also, you won't have to fiddle with
the LD_LIBRARY_PATH environment variable. It's worth a try 'stead of
immediately declaring a lost cause, no?

If you're using 'gcc' to compile and link 'aprsd' then check out the
-static option. If the makefile explicitly uses the 'ld' command to do
the linking then check out the -Bstatic argument.

Rotsa ruck!

645. Upcoming web seminar for 802.11 and WiSPs

Yahoo group: DAWG-HSMM
Date: 2005-04-21 14:39:37 UTC
From: Joe Jurecka
Topic: 645 Message: 645

Hi,

There will be a web seminar entitled Unlicensed Wireless Broadband for Metro-Zone 802.11 & WISPs on Wednesday, April 27, 2005 which will discuss business activity focused on the unlicensed spectrum which will inevitably have an impact on our amateur bands. While I do not recommend making a scene and trying to de-rail the direction of this event, it may provide some useful ammunition for the future as well as provide some insight on the thought processes of those who will raise our noise floor substantially.

http://www.unstrung.com/webinar.asp?doc_id=27368

It looks to be open to anyone...thus why I'm passing it to the group.
Joe

646. 04 Wild Ride HSMM update

Yahoo group: DAWG-HSMM
Date: 2005-04-21 15:48:44 UTC
From: J. Beadles
Topic: 646 Message: 646

NT5NT and the START / STOP

This is the highest priority of the event. If we don't have solid internet access to the Start / Stop, many of our desired goals won't be met.

The two access points NT5NT-3AP and NT5NT-4AP were installed on roof of the 16th floor last week, with testing performed last week (see previous msg). Neither performed as expected during testing last Sunday. Plan is move the NT5NT-3AP on top of the wall surrounding the elevator eqpt, using an 8db panel antenna. Will repoint the 24db grid on the NT5NT-4AP down to Lookout Park to facilitate ground testing of the entire radio system.

I'm expected to meet Kevin KD5YVL tonight to hand over the bridge radio which will be mounted on the Eisemann auditorium where the internet feed will come from. This is a WRT in one of the 19db Rootenna fixtures. Radical overkill for this purpose, but given the history of the system I don't mind that.

REST STOP 3

Doug KD5OUG and I went out to Nevada (TX) to look at Dave K5EEN's location with respect to the rest stop 3 location for the Wild Ride bike ride.

Last year we attempted an 8 mile bridged shot from the Lake Lavon Army Corps of Engineers tower to the community middle school near the rest stop. This path was marginally successful, likely due to the WAP11s we were using.

Our examination showed that K5EEN's house is about .75 miles from the middle school and has line of sight to the same playground we used last year. Dave's house and storage building are fed via a Directway satellite connection, and he currently runs APRS and Telpac feeds across it.

Dave also stores the McKinney ARCs' 35 ft towers which are used for field day. Dave will check with the clubs' board to see if we have permission to use one for this purpose.

REST STOP 4

This is an addition this year, located out near Breckenridge(?) Park in Richardson somewhere out near Renner & Murphy roads. KD5OUG reports that he has located some RACES members who live there and is negotiating with them to provide internet feeds for that shot.

REST STOP 2

This is the hardest of the rest stops to reach. Because of our goals, we're going to push to make the other paths work before putting too much effort into this.

Initial plans are to again attempt a 13 mile bridged shot from the Nortel tower to the Army Corps of Engineers 150 ft self support tower at Lake Lavon, with a separate 2m bridge down into the site on the other side of the dam. Alternate plan is to attempt a bridge from a local WISP down into the site from a couple of possible directions.

The NT5NT-4AP station is in place to do this, however, ground testing from the Lavon area, which was successful last year, failed this time around. There is likely an antenna pointing issue on the NT5NT-4AP side, which is now using the 24db grid. Poor connections were made successfully last year with a 16db panel at that location. Goal is to use a higher gain grid rather higher TX power with a panel to minimize interference into the 802.11b system on the executive floor below.

COMMENTS

Noted this last year, but for this rapid mobilization stuff these 24 db grids just don't have an antenna mount that allows for very reliable adjustment. The mount on mine is so tight that I have to whack it to make it move, which is obviously not good for fine adjustment.

Also, the antenna on top of the roof is on a pole that is in an bad position to get behind for a sight line behind the antenna. I need an optical aid that I can put on the feed point. Thinking about rigging up a cheap CCD camera behind a rifle scope or something like that.

Thinking about flexible mounting systems for antennas. I've in the past been using the ball mount system from RAM products (see www.gpscity.com). I've had a 1in ball on one of those automotive suction cups for a while, now I have one on a mag mount antenna. Going to use that to clamp that 8db antenna to the steel here on the Nortel bldg. Definitely something to look into if you are looking at keeping HSMM stuff for emergency deployment.

647. Change of Plans - Rest Stop #4

Yahoo group: DAWG-HSMM
Date: 2005-04-21 18:56:38 UTC
From: Douglas Kilgore
Topic: 647 Message: 647

It's election time. Politics rules. The location of Rest Stop #4 has been changed. No longer will it be at Miller Elementary where we had received approval and were within 802.11b line of sight to a hams house 50 yds away.

Instead the new location for Rest Stop #4 will be on the old Brand Road cutoff which parallels the new Brand road on the east side of Breckinridge park. There is a clear, unimpeded line of sight to the Nortel building. We should be able to make a link directly to Nortel.

Old Brand Road cutoff - excellent view of Nortel for testing
N 32:59.58
W 96:37.34

An alternate plan will be to canvass the neighborhood directly to east of Brand road to see if a homeowner will allow us to connect our wireless link directly to their high speed internet. I will pursue this alternative next week.

Doug Kilgore Kd5OUG
Wild Ride Communications Coordinator

Doug, can you see the fire station from there? If so, we might be able to link off the city system.

649. Re: 04 Wild Ride HSMM update

Yahoo group: DAWG-HSMM
Date: 2005-04-21 21:57:36 UTC
From: J. Beadles
Topic: 646 Message: 649

Had an opportunity to visit the NT5NT APs again, found that I did not have them all configured properly after all.

1. NT5NT-3AP had the xmit power down to 15mw (after testing)
2. NT5NT-4AP had the antenna on the wrong port. Darn it.

Boys and girls, let this be an object lesson - before a deployment, go out with a checklist, and be sure to examine the signal strength with netstumbler before you leave the site. I had checked connectivity to NT5NT-4AP and was able to see it, but did not look at the absolute signal strength.

In addition, I locked both APs to the 1-2mbps mode, and set the NT5NT-4AP (the 13 mile bridge) with the following parameters:

Set Frameburst to on
RTS Threshold set to 1024
Fragmentation set to 1023

Topic: 646 Message: 650

Success! Some success, anyway, testing against NT5NT-4AP. 28mw and 24dB grid on the NT5NT end, at 14dB panel antenna on the test side. Netstumbler used to see signal on the test end, but a bridged WDS connection using WRTs was tested also.

1. .95 miles - At lookout park, had a solid WDS bridge connection between, with only about 10dB SNR on the path. The test station was significantly below the main beam, and somewhat off to one side.

2. 5.22 miles - On Brand Road, just south of Renner. The place where I could park was definitely south of the main beam. Getting signal in the -90s. Bridge was intermittent, but was able to access the admin page on the NT5NT access point. While the panel antenna has a pretty good beam, I was right on the edge of the system threshold, so that turning the antenna even a little bit caused the link to fail.

The actual rest stop that Doug described is almost in the direct path of the main beam, so the situation should be better. I'd have tried it, but had no place to park.

3. 7.62 miles - Parked on westbound 544 in Wiley, directly in the main beam. Definitely not line of sight, the Nortel tower was obscured by dense trees. The WRT was not able to get any signal, but a client connection with the Orinoco card was able to establish a fairly reliable connection and I was able to ping the remote end reliably.

Rather odd that last. I'd read that the WRT had pretty good receive sensitivity. Well, we'll go out and try with a grid.

I am accumulating a small garage full of used 18 and 20 inch dishes and
mounting
hardware. We also replace a lot of bad LNBs in the field. I have lots of
complete
new dishes minus the LNB... Anyone who wants a truckload for non-commercial
HAM use, come get em.

I don't know why they won't issue us the replacement LNBs alone....
Perhaps like a PC power supply, its cheaper to buy the whole case?

From: J. Beadles
Topic: 654 Message: 654

Kevin KD5YVL and I installed the internet feed router on the Eisemann center, facing the NT5NT-3AP access point. The link between the APs will not be established until we can redo the antenna system on the NT5NT-3AP node.

655. Java VM Port to WRT54G?

Yahoo group: DAWG-HSMM
Date: 2005-04-25 00:12:02 UTC
From: AE5PL Lists
Topic: 655 Message: 655

I found the Mipselkaffe at http://controlap.com/loader.htm

Kaffe is an independent Java VM. Although I have not tested against it, javAPRSSrvr should work since Kaffe is supposed to be well above 1.1.4. Anyone want to try? I have also put together a jar file (about 47k instead of 163k) which is only the digipeater part of javAPRSSrvr. Further reduction in size can be gained by limiting the number of TNC interfaces supported (currently KipSS, AGWPE, Linux kernel AX.25 support, and direct /dev/tty serial interface).

Thanks to a friend over in Germany who found this link.

Pete,

Can you determine which Linux libraries javAPRSSrvr requires? That seems to be the limiting factor.

Bob

javAPRSSrvr doesn't require any Linux libraries (except if you use the kernel AX.25 support). The MIPS port for Kaffe is supposedly tested on the WRT54G so javAPRSSrvr should work as well since javAPRSSrvr only uses constructs available in Java 1.1.4 (original generally available release) and Kaffe is supposedly 1.2 or higher.

659. 05 Wild Ride - Start / Stop Internet Feed

Yahoo group: DAWG-HSMM
Date: 2005-04-28 16:28:03 UTC
From: J. Beadles
Topic: 659 Message: 659

The link between the City supplied internet connection at the Eisemann Center and the NT5NT bridge is now operational. The path is approximately 2200 feet long. The system is composed of two WRT54G units bridging using WDS, running Sveasoft Satori firmware. The Eiseman link radio is in a 19dB Rootenna. The NT5NT radio is in a sprinkler cabinet with an external 14dB antenna.

Problems encountered include:

1. Antenna port selection

I can say that I personally tested each AP with an antenna in the house before installing it. I must then say that many of them were wrong. These units put out significant amounts of RF even into a disconnected antenna port, and the RF environment in my house was sufficient to fool me in to thinking that I had the right port selected.

With the radios mounted in the environment, we were able to make contact with the radio in the rootenna enclosure at approximately 1000 feet even with the antenna switched to the wrong port. Also, if your test laptop is close to the AP, you may not see the results of the antenna pattern. In each installation, be sure to back off a distance, and test the antenna port selection.

2. High local noise

We had trouble getting the Eisemann to NT5NT link to work even though te signal from NT5NT was high enough at Eisemann to make the link, even though I could link to it using my Orinoco card and a lower gain antenna. Using the WRT's internal scan feature we determined that the noise coming off the Nortel tower from the APs in the tower were giving us about a 4dB SNR, not enough to make the link. We upped the antenna gain from 8dB to 14dB to improve the ratio. However, this means that we might not be able to get signal down into the event Start/Stop without another radio because of the narrower radiation pattern.

3. Loose antenna connections

We noticed that we were getting a lower signal strength than we expected. In fiddling with the antenna, we found that the antenna connection on the NT5NT end was on, but not tight. Tightening this connection improved the signal about 7dB (on an 8dB antenna). Check your connections!

General comments

This being such a short link, we could almost certainly get away with a lower gain antenna at the Eisemann center. However, the logistics of supplying the other sites means that this was the hardware I had to use.

For those familiar with echolink, another choice might be to use my Javecho application in concert with the login server that is in the distribution. This lets you set up an echolink configuration on a private network. I can't tell whether you'll be using a split private-public net topology or if everyone will have access through the private 802.11 network to the public network.

Topic: 664 Message: 664

REST STOP 4 LINK

A 3/4 mile (approx. 1km) path to feed rest stop 4 was successfully tested on Saturday. Dave Piekarski, K5EEN, was found to live slightly to the WSW of the school where the rest stop will be located, and has line of site to the same location we attempted to bridge to last year. A WRT in a 14dB Rootenna was lifted on a 35ft tower section provided by the McKinney ARC. Dave lives in a rural area, and receives internet access via DirecWay satellite service.

The School end of the link is behind the school building from the rest stop, on a set of playground equipment. To provide coverage of the actual rest stop location, we will once again have to run approximately 500 ft of Cat-5 cable from the AP around the building, where it will connect to another AP which will cover the immediate rest stop area.

START / STOP link

KD5OUG and I tested the downlink to the start / stop area today. This hop will consist of 2 legs, each approximately .5 miles in length. The City of Richardson is providing an internet feed from the Eisemann building, 2200 ft north of the NT5NT AP on the 15 story Nortel bldg. The start / stop area is in the national MCI Engineering Headquarters parking lot, east of the NT5NT AP.

The uplink from Eisemann to NT5NT was completed and verified last week. We tested the downlink bridge today, and were successfull, though not to the MCI parking lot. The issue that arose is that the antenna beamwidth of the NT5NT end is too narrow to cover both sites as it is currently pointed. NT5NT had to have a 14dB antenna to provide enough signal to mask the 802.11b noise out of the other APs in the Nortel bldg into the Eisemann radio. We'll attempt to turn the antenna just enough to cover the start / stop area while maintaining the Eisemann link.

Pictures will follow.

We did not succeed in getting the APs up on the tower last week due to personal schedule conflicts. We are going to try again this Saturday sometime after 1pm or 2pm. Any interested parties are welcome. Coordinate on the NT5NT repeater. 443.325, pl 110.9.

Topic: 671 Message: 671

Rest Stop 2 update

The bulk of the tower install at Lake Lavon Army Corps of Engineers tower was completed yesterday. This is a two-hop system, with a feed from a local wireless internet service provider (WISP). The rest stop is only about a mile from the WISP's location, but cannot feed the system directly due to terrain. The wisp has provided us with one of his residential bridge units, which we have placed at about 50 ft. This is ged to a router on the ground, which in turn feeds the HSMM bridge which is just under the WISP unit.

Both units are placed, we did verify signal from the wisp and the router is routing correctly. However, we ran out of daylight before we were able to test the rest stop link. We expect to be doing this today, after 3pm. As usual, we'll coordinate on 443.325 pl 110.9

START / STOP

The 2 hop bridge system that will provide internet access was successfully tested end to end and webcam pictures uploaded. This system now consists of 4 WRT54Gs connecting two hops each approximately 1/2 mi long.

RS2

We did not finish the configuration for RS2 as was planned. This may be finished up on Wednesday.

673. Equipment and Volunteers Needed for HamCom Networking

Yahoo group: DAWG-HSMM
Date: 2005-05-18 17:42:41 UTC
From: Bob and Debbie Kmak
Topic: 673 Message: 673

Guys,

Once again I'll be involved in providing internet connectivity for the HamCom forums and some exhibitor's booths.
To make everything work, we'll need several additional 802.11b or 802.11g AP's and/or routers. If you have any such equipment that you can loan to the HamCom effort for use on June 2 through June 5 please contact me directly.
My email is bdkmak at comcast.net .
Linksys WRT54Gs would be preferred but anything that works will be welcome.

Also, if anyone has a VGA color camera that can be lent to the HamCom effort please let me know. An ethernet camera would of course be the cat's meow but we can put a USB camera to good use also. We plan to create RealNetworks video clips while HamCom is in progress and post them on the web page so that people at home can get a feel for what's going on.

Finally, we'll be doing the installation on Thursday June 1st, probably starting late in the morning. We will have two internet feeds- a DSL line from SBC and a DirectWay satellite connection. If you would like to help out with the install effort please let me know. It's a big building and lots of cat5 will have to be run to connect everything together. The installation will be the bulk of the work, but the operation of the network will have to be monitored and maintained all through the HamCom operation. If you'd like to help out or want more information please contact me direct.

73,

Bob Kmak

674. 05 Wild Ride Update - Rest Stop 2

Yahoo group: DAWG-HSMM
Date: 2005-05-19 05:22:59 UTC
From: J. Beadles
Topic: 674 Message: 674

The network connection to rest stop 2 was successfully tested end to end this evening. The system consists of a roughly 4 mile hop from a local Wireless Internet Service provider to the Lake Lavon Army Corps of Engineers tower, and then back approximately 2.4 miles to Rest Stop 2. A webcam is also located at the tower. The system is operational at this time, and the webcam is transmitting photos back to the www.k5rwk.org web site.

I'll have pics later, but the at the actual RS2 location was performed by putting the 19dB Rootenna enclosure on the ground, roughly facing the tower, propped up against my bumper. It successfully bridged as soon as power was applied. Love it when a plan comes together.

678. NTMS-HSMM Hams Use 802.11b for Real-Time Support of Bike Rally

Yahoo group: DAWG-HSMM
Date: 2005-05-19 17:23:29 UTC
From: Douglas Kilgore
Topic: 678 Message: 678

On Saturday morning May 21 at Dayton Hamvention and elsewhere in the world, persons interested in HSMM can view the progress of a 64 mile Wild Ride bike rally in Richardson, TX on a real-time basis. Members of the NTMS-HSMM group have set up 802.11b webcams at each of 4 rest stops on the circular route to upload pictures to a web site:

http://www.k5rwk.org/wr/wildride.html

The real-time pictures will be used by Net Control and the City of Richardson command post to keep track of the rally. To promote amateur radio, a separate trailer has been set up at the Finish area to show the pictures to the public.

Two of the rest stops are in a rural area. Multiple hops are needed for connection to the internet. At Nevada, TX, 3 links connect to a Directway satellite feed 3/4 mile away. At Lake Lavon, 2 links connect to a local Wireless Independent Service provider 2 miles away.

At the Start/Finish area, multiple links are necessary to bring the internet connection from the City of Richardson feed point around tall buildings to the trailer and net control van location. Linksys WRT54G access points loaded with SVEASOFT Alchemy firmware and directional antennas move the signal to where it's needed in the RF unfriendly environment.

It's been an exciting, worthwhile learning experience for hams to acquire, assemble, set up and activate the 2.4 Ghz equipment for this public service event.

Watch us live on Saturday morning.

683. Lazy WDS for BEFW11S4

Yahoo group: DAWG-HSMM
Date: 2005-05-23 17:33:50 UTC
From: Randall Dunning
Topic: 683 Message: 683

Hello,

I successfully installed 1.52.02 (7 April 2005) firmware on my BEFW11S4v4 last night and low and behold it worked! Next I went in to hunt down all the new features. I found everything that interested me except Lazy WDS. There was no info, help, or menu option that gave any clue as to how to enable or utilize this feature. I spent part of lunch, navigating the global labyrinth of Linksys tech-support centers as each one scratches his or her head trying to answer the basic question: Can I mesh my 11S4 with a 54G using WDS?

While waiting I googled this topic and found 1 apparently useful post which I reproduce below from http://www.broadbandreports.com/forum/remark,13242612~start=60 courtesy of a poster named Jongoz:

BEFW11S4 has lazy WDS activated by default and it's not in the menu.

Lazy WDS means that any AP within the same channel can be associated with the BEFW11S4.

1) Use the same channel for both routers (BEFW11S4, WRT54G) but SSID can be different. No encryption for the purpose of testing. (BEFW11S4 can only use static key and no WPA support for WDS)
2) Put different IP for both routers (in my case 192.168.1.2 and 192.168.1.1)
3) Enable WDS in the WRT54G. Disable Lazy WDS but put in the BEFW11S4 MAC address in the WDS setting in the WRT54G
4) Save and reboot both routers. Fortunately for me, I got it working in less than 20 minutes.

The Linksys guy said:

You can add a BEFW11S4 to existing network with WDS but you cannot use it as a repeater itself. He confirmed the above steps as being correct for using the 11S4 in a WDS "poor man's mesh". The bottom line is, since the 11S4 has no repeater capability, it can be one of the leaves of the mesh but not one of the central nodes. Well at least this breaths new life into my BEFW11S4/WSB-24 that I spent so much money on.

Cheerio,

RD - KC5QHH

Beats me. A very quick read-through of the article gave me the impression that they were able to do this due to the extremely simple nature of the interface. No clue if a similar installation with different card types is possible.

689. 05 Wild Ride - post event review

Yahoo group: DAWG-HSMM
Date: 2005-05-23 20:10:09 UTC
From: J. Beadles
Topic: 689 Message: 689

There's a lot more to discuss than I have time to write, but here's an overview. I'm going to be writing this up as an article for QST or CQ-VHF. Also, this info will be built into the upcoming Hamcom presentations.

1. Links to all stations were made to work.

1a. The start / stop link did work over one hop at least. The two hop system suffered from environmental noise and was not entirely reliable.

1b. Rest stop 1 relied on a single AP to client link. Doug has been working getting access to this site for the past month and suffered several last minute losses of internet service providers. He was able to get something working at the last minute, though I don't know how.

1c. Rest stop 2 (2 hops) worked fine once I was able to get the equipment to the location after being delayed at RS3.

1d. Rest stop 3 (2 hops, 3 really) worked fine though setup took a bit longer. This was due to having to run very long ethernet cables on site and having to physically modify one of the bridge radios.

1e. Rest stop 4 worked fine with the link provided by a nearby resident. The link worked until 11am, when it stopped, reason unknown.

2. There were problems making the links work at the start / stop largely due to computer, personnel and environment issues.

2a. While KD5OUG and I did end to end testing, from start /stop, we were not able to use all the hardware that would be available on site and we were not personally the persons to do the hookups the morning of the event. The person who did the hookups did not have the familiarity of the system that we did and was not able to work out all of the kinks during the event.

2b. A direct link was made from the Dallas ARC van which was being used for net control. The brand new computer suffered a spontaneous failure, so net control access to the internet was delayed.

2c. The most problematic link was the hop from the internet feed to the Irving ARC club trailer. This is due to the high noise environment over the .5 mi link.

2c. The internet link to the Irving ARC van used computers for display that were not available prior to the event.

3. The web cams were problematic.

3a. The AXIS webcam at the tower had a problem before the event, but after KD5YVL got it sorted out and remounted, it worked fine the whole duration of the event.

3b. Most of the stations used small USB webcams. I'm less than impressed by these units. They seem to be totally intended to use as desktop only units, with a focus band in the range of feet. They simply could not be made to focus at practical ranges, and the images on the web page show this.

There are some low-cost ethernet webcams on the market but my experience with them has not been good. I've had 2 Dlink units fail quickly, and neither would reliably FTP a pic onto a remote server. Tjhere is a better quality of webcam from AXIS. The obsolete 200+ model works fine and can run an auto-iris lens, if with poor dark performance.

There is a webcam software called WebcamDV, which allows a DV (digital video) camcorder to be used as a webcam over a firewire connection. I think I'll be investigating this. Another option is to use one of the better grades of cheap surveillance camera ($100+) with a USB video grabber unit. This solution is in the $200 range, but should work much better.

3c. The webcam software was problematic. Several of the stations used a package which could not interact well with the server. It kept adding an incrementing number on the end of the image file name, preventing it from being recognized. I did not have access to this beforehand to fix. I thought I'd be able to do it the day of the event, but could not. There is a cheaper (if somewhat cheezy) solution called ConquerCam ($10 with a free 30 day trial) which worked fine.

3d. The webcam photo updater script worked well, with reservations. My web server provided anonymous FTP access for stations uploading photos. All stations were requested to use their call as a password, uploading files once per minute. This was taken to satisfy their call ID requirements. I wrote a small PERL script to transfer the photos to the web directory and to create a thumbnail image. The intent was to provide an index page to all the thumbnails, but this could not be completed before the event.

As I could not make the previously mentioned webcam software stop appending a number to the file extension, I had to run home (35 mi!!!) in the middle of the event to modify the script to parse the number off those image files. Once I did this, those files uploaded fine.

Also, the APRS web page had to be updated with all of the APRS ssids during the event. The script provided for copying these files into the proper location. Because start/stop had their internet access delayed, it appears that this never got done.

Jeeze, how can it be that hard to set up a couple of access points and run a few web cams? Any teenager can do that these days! ;-) ;-) ;-)

Sounds like you had lots of fun and the almost inevitable dose of frustration! Congrats for attempting all this and getting most of it working. Until you do it yourself, nobody realizes just how hard it is. Specially when trying to fit into a tight budget.

Cheers,
Thorsten

691. 2.4gig fresnel question

Yahoo group: DAWG-HSMM
Date: 2005-05-24 00:03:30 UTC
From: Wes Johnston
Topic: 689 Message: 691

I am trying to link a ham's house to a water tower 2.17km away. I climbed to the top of his tower and in the last 5 feet of my climb, suddenly the water tower revealed itself to me thru the trees. About 1/3 of the way to the site, there is a tall pine tree which obscures a fair amount of the tower. I can see only about a 20' square patch of the tank (the tank is prob 50 feet diameter and 20' tall.) Our plan is to put a parabolic dish on the hand rail of the tower, which I estimate 3' above the hand rail is where I start to see the tank. My question is this 20' square "hole" in the canopy enough to shoot thru? I'd hate to spend $90 or $100 on a pair of antennas only to find out it won't work.

The link budget calcs from radio mobile say s9+10 with 30mW, s9+20 with 250mW. 24dBi antennas at each end.
Wes

Ouch! That's a killer. Where is this, Wes? If you are close, we could try it...

If it's only one tree, it might still work, with reduced signal level, or you might overcome it with a power amp or Senao radios.

Alternately, this might be a good application for some surplus 900MHz gear.

Budget?

Heh heh heh! Yeah, it was typical, but now we have a better idea of
what we can and cannot do. Now if I can remote a telpac node or APRS
digi, I'll have another demonstrator.

From: Dave Anderson
Topic: 689 Message: 694

Years of experience with this and tons of installs under my belt with this, I'd say if it worked at all, it'd be problematic and have retries and CRC errors due to the multipath...

There are near line of site solutions that would work perfectly in this environment, but the radio's are the typical consumer grade stuff.

John,

Super! Please let me know, if we can help you in anyway with the publication of this. For example, I have a deadline coming up for our regular HSMM column in CQ VHF, and we could readily publish this as an e-mail from you, etc.

Thanks and 73,
John - K8OCL

Sure thing! I actually have a full article in mind, though I'll work on filling out the report presentation in the next few days, and you should be able to draw from that as desired.

Not sure if this made it to the list already, but

http://db0fhn-i.ampr.org/wrt54gs/

has some Ham radio centric links for the WRT54, including a link on
how to move it below 2400mhz.

From: J. Beadles
Topic: 699 Message: 699

As programmming director for Hamcom, I'd like to say thank you to Bob Kmak, Eric Lester and the Directway folks for providing internet service to the Arlington Convention Center this last weekend. Directway provided a satellite internet feed and Bob and Eric strung wire and laid out the part15 802.11b network that was used by presenters, attendees and vendors alike.

Bob, when you have an opportunity, can you describe what all was involved?

Yep! I'm intending to try this to see if it'll help with Bob Kmak's attempt to compile APRSD into a Sveasoft load. Speaking of which, if anybody on the list has experience compiling apps into Linux, please feel free to get involved and let us know what you are doing.

One of the other things I would like to see done is to see a telpac linux port. Telpac is a Packet to Telnet interface that is used for the VHF Packet version winlink. My county ARES org is adopting winlink, and a deployable package based on the WRT would result in a much cheaper deployable package. Problem is that the current developers are only doing Windows development. While they support the concept of doing a Linux port, they don't have time to do it. So I would encourage anybody interested to get involved.

Incidentally, John Hansen, the developer of the TNC-X, was here at Hamcom and we discussed the WRT54G / TNC-X combination. He really likes the idea, but is too busy to pursue the combination.

Outstanding! I did a bit of research down this link and had a hard
time figuring out exactly where the downloads were. Found them a bit
more directly here:

http://db0lj.dyndns.org/pub/dl5di-soft/

Bob, this might be more worth your time than porting APRSD just now...

I have admit that neither of these links was enlightening to me. I have
a radio, battery, antenna and desire to build a telpac node
from a WRT54G ... I guess I should just buy one and try to figure it out.

Telpac_node runs on a Linux system with the AX25 packet drivers. Our goal is to get AX25 running on a WRT54G, then we'll probably be able to run telpac_node there. Until then it will require a standard Linux packet system to run telpac_node. We're probably months from seeing AX25 on a WRT54G unless somebody proves me wrong - which would be a good thing.

Ah, now I get it. Is there not a KISS-mode port? I was thinking
that a TNC-X would be part of any WRT54G deployment, be it APRS or
Telpac.

Some applications like Xastir, APRSD and JNOS have native KISS modes. The telpac_node package replies on the built in AX25 system. Probably wouldn't be terribly difficult to replace the ax25 hooks with a serial port but I think we'll be better off overall focusing on getting AX25 running on WRT54G(S). That will open the device up to many applications.

I love it when journalists get it wrong...

"Also, some critics point out that Wi-Fi routers do not necessarily stay in one position forever like satellites or cell towers do. People often move and take their Wi-Fi routers with them."

I didn't know GPS satellites stayed in one place! lol.

I'm guessing this system is simply RSSI for each AP seen.... it maybe a good approximation, but I can't see it working better than GPS, even in the urban canyons. Perhaps deep inside a building or parking garage, but on the street, even in a city, no chance of working better than GPS.

Wes

Better than GPS?

Let's see. I get about 15-20ft error without differential corrections on my receivers once they've got all the almanacs, ephemerides and so forth.

If I can see the 35th bird that's in geosync and offering WAAS differential corrections I've seen my position error drop to 6-7ft!

Both of those are considerably better than the 20-40m that Skyhook is supposedly able to come up with.

OTOH, it would be interesting to build a location system using WiFi. Essentially one could theoretically build a mini-GPS system using three WiFi transmitters, figuring out the latency across the system and then writing some software to perform the trig operations to determine the location of a receiver. Although, now that I think of it a little bit, you'd probably need four transmitters if you wanted any kind of accuracy for altitude. But you could make three work for a flat-2d fix.

I think this might be for Voice over IP and 911 locator services. One of the problems with rolling the VOIP product out was how do you find someone inside a building or someplace other then were you thought the phone was when you can't use a GPS satellite.

Just a thought.

Frank Roesch

For a non HSMM reason, I picked up a 9100A Network video server off ebay. This is a 4 port digitizer and web server, and can FTP images based on a motion trigger. The built in software is a little yucky, but it seems to work. They are available on eBay, but this one is cheaper at $99.

It seems to have the ability to do both. It seems to work ok, but the software is really awkward, as if the developer doesn't know how to do consistant user interfaces. It has a built in web server that downloads a separate component that receives streaming images. The interface allows you to split the screen up to 16 ways, and allows you to add video sources from other cameras. The web interface allows you to set a number of image quality parameters, but as mentioned earlier, the interface is terribly inconsistant in operation. The web interface allows you to automatically save images and/or AVI files to the local hard drive. However, it seems that it can only save one of the images from one of the 4 video inputs at a time. Shoot! The saved images are timestamped, but the images themselves are not overlaid with timestamps. The image quality that comes from it is fine. The unit comes in a mode where it captures images every 60ms. This draws enough CPU that my old 133MHz PC was unable to spare cycles enough for me to interact with the web browser. The unit also comes with some PC client software that I haven't tried yet. It does require a 1024x768 display or it won't run. It does have a feature that allows you to FTP or email based on a motion trigger, but I haven't tried this yet. This should allow the device to operate in unattended mode. I've had it running this way for several all night and it is still running. I was able to get the system to lock up while fiddling with the controls and had to cycle my browser and the unit power. Conclusion - An imperfect box, but definitely the cheapest based on the functionality. There are others on the market, but the cheapest I've found runs about $400. The poorly written docs indicate that the unit runs on linux, and the interface has a place to upload new firmware. Therefore it does seem like this is fixable by some intrepid individual. John,

Are you going to use this? If not, I would like to consider it for my next
CQ-VHF column on HSMM.

Thanks,
John - K8OCL

716. July NTMS Meeting on Saturday July 23rd

Yahoo group: DAWG-HSMM
Date: 2005-07-14 01:08:30 UTC
From: Bob and Debbie Kmak
Topic: 716 Message: 716

Guys,

Please join us for the July NTMS meeting. See below for driving directions.
Here are the details:

NTMS Meeting Saturday, July 23rd, 2005

Room 418 of the Union Building, University of North Texas campus.
Flea market & chat starts at noon, official meeting at 1 PM

The agenda:

"The 2005 ARRL VHF QSO Party", by Eric Silverthorn, NM5M

"Report on the 2005 Society of Amateur Radio Astronomer's Conference", by Al Ward, W5LUA

"Benefits of Increased Dish Antenna Heights for Microwave Rovers", by Kent Britain, WA5VJB

"Providing Wireless Internet Access at HamCom 2005", by Bob Kmak, K5WO

Directions to UNT

From Dallas:

North on I-35E to Denton

Exit North Texas Blvd, turn right at light

Travel two blocks, turn right on Eagle Drive

Travel approx. ½ mile, turn left on Welsh St.

Travel three blocks, turn left on W Prairie St. (one way street)

Take first left into parking lot

W Prairie St., Avenue A and W Chestnut St form a square

The Union Building is on Avenue A.

Meeting in Room 418 of the Union Building, on the fourth floor.

From Ft. Worth:

North on I-35W to Denton

Exit W. Airport Rd (FM1515), S. Bonnie Brae, not sure how exit is marked

Turn right and proceed to the I-35E service road, turn right (towards Dallas)

Travel to North Texas Blvd, turn left, crossing over I-35E

Travel two blocks, turn right on Eagle Drive

Travel approx. ½ mile, turn left on Welsh St.

Travel three blocks, turn left on W Prairie St. (one way street)

Take first left into parking lot

W Prairie St., Avenue A and W Chestnut St form a square

The Union Building is on Avenue A.

Meeting in Room 418 of the Union Building, on the fourth floor.

73 and see you there!

Bob, K5WO
NTMS Vice President

------- Forwarded message follows -------

[Double-click this line for list subscription options]

All day yesterday and through the night Team PAD (http://www.wifiworldrecord.com) braved rain, lightning and winds over 30 mph to setup and test their equipment at their mountian top base outside of Las Vegas, Nevada.

Today at 11am they successfully made a 125 mile link using 802.11b and ran network applications with their remote team in the mountains West of St. George, Utah. Link built using Part 97 rules.

More to follow, including photos, video and hardware details.

Thank you

Frank Keeney

They had to tweak the timing otherwise they wouldn't get 11 MB throughput.

Walt,

Indeed, and I don't even know of any enterprise grade gear that allows the timing variables to be tweaked for that much of a distance, so it had to be hacked firmware.

I don't think they hit 11mb, they probably went with 1mb/sec to get the higher receiver sensitivity.

Seeya,

I'd be very surprised if they actually got anywhere near 11 mbs thoughput no matter what you do to the timing. I figure by the time you delay things enough to get around the constant retries, you would be lucky to get half the throughput. Just my hunch. At any rate, that is one heck of a hop, makes my 18.5 mile hop to the repeater site look like a walk in the park.

From: Thorsten von Eicken
Topic: 723 Message: 723

Obviously there are a lot of N-th party accounts floating around...
However, it may well be that they were able to get packets at the 11
Mbps phy rate through. That's very, very different from getting 11 Mbps
of data throughput! Over those distances, if I got my math right, you
can't get more data throughput than about 25%-30% of the raw bit rate.
In terms of "tweaking the timing", all they really need to do is change
the ACK timeout. The madwifi Atheros driver allows that to be done very
easily, however, at least for the Atheros chip sets I'm using you can't
set the timeout large enough for these distances. I'm running a 32 mile
link and I'm at 95% of the max for 11g mode and I don't believe that the
11b max is 3x higer.
Thorsten

Wow, I've been looking for that stuff! Thanks for the link! The last bottle I had cost me over $25. Of course that bottle was a caramel colored liquid, and said "southern comfort" on the label... but it did make my internet seem to run faster.

Oops, I may have given away your competitive advantage. Good trick, disguising your Wifi speed spray as Southern Comfort! :-)

I saw John pay $10 for a bottle at the Austin SummerFest. I asked the vendor why so much and he said that John really wanted a bottle.

I offered him $2 and the took my money and gave me a bottle.

This stuff is going fast.

728. old, big dish

Yahoo group: DAWG-HSMM
Date: 2005-08-15 03:17:29 UTC
From: Dave Dunbar
Topic: 728 Message: 728

A friend has one of those old TV satellite dishes -- back when they were *big* -- and is about ready to get rid of it. Is there any use for them, or any demand for them, in this area (Collin County, TX)? He'll give it away, he just needs it hauled off.

I saw the 125-mile article (prev. msg.), and noticed they had a fairly
large dish, so wasn't sure if my friend should just junk it or if someone wanted it. If I don't hear something in a week, I'll assume it is worthless and unwanted.

Thanks & 73,
Dave N0RQ

729. Karlnet 2.4GHz

Yahoo group: DAWG-HSMM
Date: 2005-08-15 03:28:17 UTC
From: Dave Dunbar
Topic: 729 Message: 729

I used to have DFWAIR.net as my ISP here in Melissa, using 2.4GHz 802.11. Since DSL came to my area, I discontinued wireless service and now have no use for the equipment.

They told me that my board type is a KN100 by KarlNet. The radio is in the antenna box, with POE running it, and a small box inside, which
my router plugged in to. The doc is at:
http://www.karlnet.com/Documents/DocumentsManuals.htm

I'd like to get rid of it, as I have no use for it. I wondered if it would be at all useful from an amateur HSMM perspective, and if so, a ballpark value. (I paid $300 it originally from DFWAIR.net.) Or if it not much use for HSMM, then any good ideas on how to sell it (ebay or ?) would be appreciated.

Thanks & 73,
Dave N0RQ

Speed spray, eh? I suspect it contains a time honored secret ingredient that has been in a long and extinguished line of products hawked and sold since the days of the old west. I think those old timers used to call it "snake oil".

731. 05 Plano Balloon Festival - HSMM activities

Yahoo group: DAWG-HSMM
Date: 2005-08-18 23:51:14 UTC
From: J. Beadles
Topic: 731 Message: 731

All,

APRS conversant Volunteers are needed to work the Plano Balloon Festival. The Festival will be held on September 16, 17 and 18. The event will run for all three days, with each day requiring three shifts.

The event will have two launches per day, one in the morning and one in the evening. Approximately 12 volunteers (resource type S) will be needed on the balloon launch field for each flight. More than 40 vehicle mobile teams (Resource type M) of at least 2 persons are needed each flight for balloon recovery. Volunteers should expect to be on site at the following times:

Morning Launch - from 6:30 a.m. to 10 a.m.

Afternoon talk-in - from 10 a.m. to 4 p.m.

Evening launch - from 4:00 p.m. to 8 p.m.

We provide public safety communications during the event, and balloon tracking safety service during the launches. We actually track the balloons from the time the launch until they are found by their chase crews to ensure that everybody is recovered safely.

For this event, I am requesting volunteers for the following HSMM activities:

1. Launch field coverage

We need to bring in wireless internet to the launch field so that we have access to real time weather data. I can forsee two hops into the park, one into the field ops / festival command area, and another into the pilot briefing area.

2. Refuelling coverage

I would like to have internet coverage and a webcam at the refuelling area so we can do digital data collection of the balloon crews.

3. Hotel

The balloon crews stay at the Southfork Hotel in Plano. Keith KE0FV indicates that the hotel has installed Wifi over the hotel rooms, but not in the conference center where the pilots briefing is. We belive that a wired connection can be run to that area, but we will need to provide an access point or two. This is Keith's action item.

My 14 dbi Rootenna with a Senao CB3+ Deluxe Client/Bridge using
Power-over-Ethernet will work just fine.for the pilot briefing area. I
can provide a CAT-5 cable to be hooked into the director's computer.

I have a D-Link 900 IP camera that can act as a server. It does OK for
pictures in bright light but it won't work in darkness. Subjects would
need to be placed within about 10 ft or closer. Internet connection and
capture software would need to be worked out.

I have several Linksys BEFW11S4 units with amplifiers. We need to
make sure we can place the access points high up in the rooms to get
coverage. Also 110VAC is needed for power.

Thanks Doug! Can you take that hop from the demo house into the south end of the launch field again?

Also, I got ahold of Gene Losey at UDS, and he's happy to give us a feed into refuelling. I'm heading over to the Bank of America bldg to get some contact names, see if they'll let us borrow their roof for a couple of weeks.

If that doesn't work, I have a friend who is head of
safety at DART and can probably get us a spot on the
Parker Station DART terminal. (A LOT closer!!)

736. wifi from airplane

Yahoo group: DAWG-HSMM
Date: 2005-08-26 18:27:04 UTC
From: kd4rdb
Topic: 736 Message: 736

Does any one have any experience here?

I have not been able to test this YET, but I have two ideas.

1) I have a 15dB cushcraft yagi that I will mount to a tripod inside a small plane aimed sideways out the rear side window. The plane can turn about a point on the ground (ie the other end of the wifi link) and if that station uses an omni antenna, we'll be able to maintain contact from within the plane. The question here is how far? I'd love to see about a 2 to 5 mile radius here. The power level is 200mW.

2) The owner of the plane has expressed an interest in installing a NMO mount under or above the plane. Another ham has recommended he mount the NMO on the top, I think on the bottom. The bottom will not give us as much clearance, and there is the possibility of striking debris when landing. I worry that mounting the antenna on the top will cast a "shadow" over the intended coverage area - but it is definitely the preferred place. The other guy is acustomed to trying to reach the visual horizon for 2m radio contacts, and I don't expect my wifi to go that far. Can anyone offer any input on this?

also, does anyone know of a source for a 5 to 7 db mobile wifi antenna that is NMO?

Wes

Sounds like fun :-) Wouldn't a 14dBi panel type be easier to deal with?
I believe a 15dBi Yagi is ~20" long. With a panel you could hold it
right against any window.

I don't think an omni on the ground is a good idea. They give 360
degrees coverage in the horizontal plane, but only a few degrees
vertical (how much depends on the gain). I believe you'd be much better
off with something like a 9dBi panel pointing upwards roughly in
aircraft direction. I'd also mount a panel on the aircraft, could be
flush with the bottom, no?

Let's see, if you use something like a CM-9 radio you'd have 18-19dBm TX
& 9dBi gain on one end and -91dBm RX & 15dBi gain on the other end. Off
the top of my head I would expect 10-15dB noise margin at the base 1Mbps
rate out to 4-6 miles. Check out one of the online calculators for a
much better approximation, but if the calculator gives you at least
12dBi margin you stand a chance of associating and getting some traffic
through, at least that would be my guess...

Oh, and if you go over a couple of miles be sure to figure out how to
tweak the RTT timeout in the wireless cards so you don't end up with
endless retransmissions...

Thorsten

Pay particular attention to the beamwidth patterns of both antennas. The CushCraft that you mention has about a 30 degree cone off the end. I assume you will be using vertical polarization. What pattern does the ground antenna have?

Beause of the radiation patterns, I think if you use an omni it should be mounted on the underside of the airplane.

It would be an interesting experiment to have a SECOND access point in the plane with an omni directional antenna under the airplane operating on a second channel. Connecting the two together would make a WiFi repeater in the air.

I have read some accounts of Net Stumbling from airplanes. I Googled on "net stumbler flight" and came up with come interesting results.

Good luck. Let us hear about the results.

The patch antenna is a good idea, I'll have to see what the dimensions of the rear window in the plane is.

Although I see it will help the link tremendously to have a directional antenna on the ground, it's probably impractical to keep it rotating all the time.... hold on... If we had a wireless AP that we pointed up at a 30 degree angle and mounted to a azimuth only rotator... and we supplied a battery to it that would run it for some number of hours, I could rotate the whole thing around and around with no wires to tangle. Access to the hub would be via 2.4Gig in the near field for all the laptops. With APRS on the plane, we'd know where to point the antenna.

Thanks for the suggestions... we'll see what (who) else comes out of the wood work.

740. Hurricane Katrina recovery efforts

Yahoo group: DAWG-HSMM
Date: 2005-09-02 17:04:14 UTC
From: J. Beadles
Topic: 740 Message: 740

All,

If you've been getting information from your local emergency coordinators or your ECs, you will know that there are amateur operators intensely involved in handling emergency response traffic related to Hurricane Katrina. The call for additional volunteers to supplement this effort has thus far been limited.

What we're seeing now is that refugees from the gulf coast area are being relocated to cities throughout Texas. Some are arriving in the Dallas - Ft. Worth area. There is a possibility that we might be activated to provide health & welfare traffic in facilities where immediately available mass communications do not exist.

There is a potential opportunity for operators to set up HSMM networks in such facilities, using bridged links where necessary. Everybody might want to stay aware of the situation and be prepared to offer HSMM installations where appropriate. If you are so prepared, you may want to make sure your county RACES or ARES coordinator knows you have that ability.

Obviously don't go overboard, but remember that high speed networking is another tool in our communications toolbox, and should be used where appropriate.

I would like to comment on this issue. I have been running Redcross traffic from the shelters in Orange Texas for the last week, and the greatest issue that I feel is the lack of internet connectivity at these shelters for the 'guests' we are not equiped in this area for anything like that. Some of the shelters have internet but it is not readly availabe to our friends from La. The redcross has stoped us from handleling any health and wellfare traffic across the local two meter nets and these folks are desperate to find family members. We have just gotten setup in the local shelters for that by a gift from Walmart of computers but some of them do not have internet connectivity so I dont know how that will work. For the future a deployable hight speed data link and computer network would ease some of these problems. The issue is working itself out now but it has been a week since we started this effort and thats a long time to wait for information on family. No equipment please, but lets put our heads together and develop a rapid deployment scheme for the future. We dont have many ham's in this area that even have packet equipment, so it must be able to work a 10 kilo range with low antennas [no hi [structurs we can get to][mesh?] and be quickly setup and taken down. Thanks for your prayers and wishes and the folks we have here in our shelters [most arrived Before the Hurricane hit] are fine folks any one would be happy to have live close by.

Richard,

IMHO is a pieceof cake to do...you need a hub with as many ports as you have computers, an WET-11, 1 WAtt BDA may be necessary and probably a gain directional antenna at the input side.

At the end connected to the Internet, you need a WAP11 and maybe a BDA and probable a going antenna. Run the ourput of the BDA into an INternet connection.

Then you got it done.

BTW, that's the system/set up I am running on now in Dallas at the Texas Baptist Men's Disaster Relief operations center.

Richard,

I have a scheme for specially designed bridge radio based around WRT54Gs and 19dB rootennas, with some additional work. After building up a couple for myself, I was asked to build four for the Irving ARC. It's a bit large, but reasonably cheap and very flexible. I'll have to do up the documentation, but have been planning on writing up a QST article based on their use. You'll be interested in this, I think.

744. Wireless Internet [was] Hurricane Katrina recovery efforts

Yahoo group: DAWG-HSMM
Date: 2005-09-05 15:31:59 UTC
From: KC2MMi
Topic: 744 Message: 744

Rich-
<< it must be able to work a 10 kilo range
with low antennas ... quickly setup and taken down. >>

Hams using the power we are allowed (100 watts ERP) on conventional WiFi equipment can make that range. The antennas are available from many web sites, as are recomendations on the high-power cards and access points and even power amplifiers. Low antennas may be problematic, because they can be low but line of sight still counts for more than any amount of raw power.

As I see it, the main problem to using this is ham attittude. You know, "If anyone can buy it, it must be like CB or FRS and god help us, that's not an exclusive enough club so let's shun it all."

The equipment is available off the shelf and the learning curve should be near zero for a ham. Yes, the good stuff still costs money--but it is in a consumer price range from "big box" and mail order suppliers.

As WiMax and the other higher-power technologies deploy this year, you won't even need a ham license to get wide areas and high power.

745. Stompbox - mobile access point, Winlink (telpac) node

Yahoo group: DAWG-HSMM
Date: 2005-09-06 20:28:56 UTC
From: J. Beadles
Topic: 745 Message: 745

Attached is a link to the plans for StompBox, a mobile wifi access point device. It uses a single board microcomputer, a 1xEVDO wireless data card and a Wifi card to act as a portable router. Should be simple enought to put a TNC & radio on it and turn it into a portable Telpac node for VHF winlink. This would be a way to pull up to the edge of hot zone and provide VHF Winlink coverage, or put temporary Wifi service instantly into a location.

1xEVDO is a wireless data service that provides up to 2.4mbps over a compatible cell phone connection. Local Verizon Wireless adds have the service at $59 for unlimited data. I belive that Sprint is preparing to roll out their service as well.

http://www.stompboxnetworks.com/

Obviously this only works in a limited area and would not work where cell phone service goes down. But it should work right up to the edge of the 1xEVDO coverage area.

748. WiFi gets a big government blessing

Yahoo group: DAWG-HSMM
Date: 2005-09-07 10:59:00 UTC
From: KC2MMi
Topic: 748 Message: 748

Last night ABC-TV played an interview taped earlier yesterday with a Port Authority (NY/NJ) team that has deployed to New Orleans to restore communications. The team member said they were "establishing a wifi bubble" which allowed VOIP, phones, computers, internet, etc. in the immediate area, with an uplink out to the internet and the world via a one foot satellite dish supplied by Unisys from Long Island.

This meshes with discussions about using WiFi in ARES, it confirms that WiFi can do the job. And, perhaps it explains part of why OEM has been slow to embrace ham radio: They've got the same [sic] technology but upscaled, and under the control of their own secure personnel.

An interesting development. Does anyone know anything more about the official use of WiFi by NYC/NYS agencies? Or the PA? they mentioned that "this" is the technology intended to be used to ensure disaster comunications here in NY, in the event of another major incident.

751. RE: WiFi Antenna on Airplane:

Yahoo group: DAWG-HSMM
Date: 2005-09-08 14:33:07 UTC
From: Randall Dunning
Topic: 751 Message: 751

You will have to update the weight and balance information for the aircraft and have a A&P sign off on the installation otherwise the airworthiness certificate may be called into question resulting in a very unpleasent interaction with the FAA.

752. WIFI from a plane

Yahoo group: DAWG-HSMM
Date: 2005-09-19 20:12:11 UTC
From: Wes Johnston
Topic: 740 Message: 752

We ran an experiment this weekend from a small aircraft. I mounted a 15dBi yagi on a tripod in the rear seat of a plane pointed out the window and circled a house in the middle of nowhere that had a wrt54g on the roof. Power from the wrt54 was 200mW into the stock antennas. An obstruction on the roof ended up blocking about 90 degrees of the omni pattern from the wifi antennas, and the wing of the plane blocked a large portion of the horizon relative to the yagi. Ended up with the yagi pointing foward of the wing about 30degrees looking out the pilot's window/over his shoulder.

Results were good in so far as signal strength goes... -75dBm peak... and as the plane rolled and yawed, we were able to watch the signal slowing fade and come back... gave the pilot a feel for just how accurate it was to aim.... not very difficult.

The problem we did run into was that as we circled the house at 70knots (just over stall speed - with the flaps down too) at a range of 1.02 nautical miles, we'd go around too fast. By the time the wifi card realized it could see a router and began to DHCP, we were 1/2 around the house. I did get a DNS lookup of serveral websites, but never could get one to come up due to the time we had signal.

An additional problem we had was that there was some other air traffic moving thru the area, and we were asked to stay at 2500'. Well... 1/2 mile up and 1 mile out is 30degrees up. If we could have gone down to say 1500 feet, perhaps we could have gone out further and made slower orbits.

If I go with a higher gain antenna on the ground, it won't see up too well. So one solution that comes to mind is to tilt the antenna over 20 to 30 degrees so that the main omni lobe goes up into the sky (and 180 degrees around, it'll be in the ground. If I were to take a pair of lazy susans and mount them to the top and bottom of a wedge shaped mount, I could rotate the wedge without rotating the antenna... it would appear to wobble. If I kept the high side of the wedge pointed at the plane the main lobe of the antenna would be aimed at the plane. This would NOT rotate the antenna, so there would be no tangling of cables... just flexing the coax all the time.

Another idea that came to mind was to take advantage of the diversity antennas already on the linsys. I could mount two high gain omni antennas so that they tilted towards each other and effectively made two main lobes up into the sky 180degrees apart. Of course I'd probably loose signal at the 90 and 270 points... so they could be make to rock back and forth manually.... ie tilt them to the left when the plane is "over there" and tilt them to the right when the plane is 'over there".

My final idea would be to explore roaming. If I used two wrt54g's to get a total of 4 antennas mounted in the tilted fasion mentioned above, each tilted to cover a different 90 section of the sky, then as the plane circled it would appear to roam between the two access points as it came in and out of coverage of one or the other. Or four 90degree panel antennas pitched upward.

Anyone tested roaming with the sveasoft firmware? How does a person connect 4 antennas to 1 wrt54g? or do you just use two wrt54g's and roam between them?

another idea is to mount a NMO omni antenna to the plane's belly. I can't find an NMO mount WIFI antenna, so I was thinking of taking my war driving mag mount el-cheapo 7.5dbi antenna and unscrewing it from the base, and fabricating a piece of nylon to fit inside an NMO cap with a screw head sticking down thru. I just need to figure out the thread pitch on that 6 inch antenna mast.

Wes

753. Re: [ntms-hsmm] WIFI from a plane

From: Thorsten von Eicken
Topic: 740 Message: 753

Very cool! Thanks for the informative write-up!
The problem with using diversity is that an access point only transmits
a beacon on one antenna, so as a station you're dependent on hearing
that even if your data traffic goes through the other antenna. If you
are using madwifi, the beacon xmit is initiated by the driver and I've
toyed with the idea of modifying the driver to send out a beacon per
antenna. That should be a fairly simple mod, but I've not looked into it
in any detail.
Regards,
Thorsten

Hi, you may already know about this, however I'll add it just for those who don't; Robert X. Cringely the aircraft and technology columist with PBS, wrote several articles in the summer of 2004 about "WiFi-in-the-sky" with WRT54G's using the Sveasoft load in his "funky homebuilt airplane".
<http://www.pbs.org/cringely/pulpit/pulpit20040715.html>
and

I think the sveasoft firmware can allow you to select AUTO for TX and RX, meaning that it'll transmit on the last anntenna a packet was heard on.... I think.... gotta test.

756. Re: [ntms-hsmm] WIFI from a plane

Yahoo group: DAWG-HSMM
Date: 2005-09-20 04:22:52 UTC
From: Thorsten von Eicken
Topic: 740 Message: 756

Ok, I don't know what driver the sveasoft code uses. I just looked up in
a 6-month old version of madwifi. Here's the code (you can read the
comment):

```
/*
* Check recent per-antenna transmit statistics and flip
* the default antenna if noticeably more frames went out
* on the non-default antenna.
* XXX assumes 2 anntenae
*/
otherant = sc->sc_defant & 1 ? 2 : 1;
if (sc->sc_ant_tx[otherant] > sc->sc_ant_tx[sc->sc_defant] + 2)
ath_setdefantenna(sc, otherant);
sc->sc_ant_tx[1] = sc->sc_ant_tx[2] = 0;
```

So if the "other" antenna has transmitted 2 frames more than the
"current" antenna, it sends the beacon out on the other antenna (i.e.
switches antenna). Looks like if you keep communicating while circling
the base station then the beacon should switch antenna in the overlap
zone of the two antennas. Just don't make a pause and go half-way
around! Ha...

NMO mt antennas(2.4ghz) are available from Maxrad !!! They have a dual 902-928/2400-2500 low profile design(saltshaker) as well as about a 6" tall 2 coil whip!!! Works well!!! Be sure to use solid center double shield low loss cable such as LMR-240 or Antennex MBD or Larsen nmok ud nmo mts w/cable and reverse tnc for Router/AP !!! 73 Brian

758. Direcway Satellite to 802.11 at RV Show

Yahoo group: DAWG-HSMM
Date: 2005-10-01 03:38:43 UTC
From: Douglas Kilgore
Topic: 758 Message: 758

At the Dallas RV Show at Market Hall (Sep 29 - Oct2), a representative from Global Satellite Solutions of Arlington, TX was demonstrating the Direcway Satellite Internet.

He had a Direcway antenna mounted on his Suburban outside the door of the hall. He was using a Linksys access point with a 1 watt amplifier feeding a 15 inch omni on the roof (12db?). The signal came thru the glass doors to his booth located close to the door. He had a 802.11 bridge in the booth feeding his computer.

I asked if he was a ham but he wasn't. I told him about how we used Direcway for a feed at the Wild Ride bike rally this year.

His business is to install these systems on the big, expensive RVs.

There was another vendor which had a laptop with 802.11. He was getting an internet feed from the Market Hall. He was charged $200 for the service. And the coverage wasn't very good either. Too bad he didn't talk to Direcway before the show.

Doug,

Do you have the name and phone number of the Global Satellite Solutions of Arlington, TX?

I am currently using Starband to a local 802 network and two D-Link APs inside our 40 ft trailer. There is lots of latency in Starband and its not any faster (if as fast) as a 56K landline modem. I'd like something a little faster; but the Starband price is right.

Walt/K5YFw

I have an AP and wireless laptop that I take with me on such support activities. It's a must for me. If you aren't doing this, your missing another type of support that is vital to emergencies.

There are a great deal of things that are at issue here. One, at the forefront, is what the situation requires. If you have tools and skills that help, use them, or loan them etc. Ham Radio is a service. It takes skill (licensing and training) and tools (radios, power, antenna etc) to use it effectively. Other types of comms and infrastructure is just a part of the picture.

We're talking about emergency services here! Emergencies need lots of different services. Communications is the one that ham radio has always been entrusted with. The types of communications that people use has expanded beyond voice.

Voice comms can be confusing too. So, written down, typed, digital messages are more preferred for lists of things, or quantitative information. Wifi networks make this easy for close in needs. We still need Ham equipment for longer distance comms in some cases. As the Wifi/3g networks proliferate, the distance to a working one will shorten to the point that setting up bridging will be one of the skills that an EMCOMM support person might need to have.

Change is the only constant...

764. Flash Recover on a WRT-54G

Yahoo group: DAWG-HSMM
Date: 2005-10-07 18:00:44 UTC
From: Ron Cole
Topic: 764 Message: 764

Has anyone had any luck recovering a 54G that has a bad image in its flash memory?

I loaded a bad BIN file to my WRT54G and now it will not boot. I also did not have it configured for tftp updating on boot.

I have tried to do the FLASH CHIP Pin Short recovery method found on the internet but I cant seem to get the thing to come up so I could update the thing.

The Ethernet port comes up but the IP Stacks never start so I can't start a TFTP session.

Suggestions?

Ron

>Has anyone had any luck recovering a 54G that has a
>bad image in its flash memory?

The WRT-54G has a JTAG port on it on the motherboard.

You can build a interface cable for this port and recover the unit.

Details here:

From: KC2MMi
Topic: 764 Message: 766

Ron, I don't remember the process but do recall seeing it mentioned in some of the web sites dealing with hacking the 54G and loading your own system onto it. There are some recovery processes mentioned in case that fails, IIRC one simply involved doing something very quickly before it could commence it's usual boot.

767. HSMM at Hamcom in 2006

Yahoo group: DAWG-HSMM
Date: 2005-10-31 15:56:05 UTC
From: J. Beadles
Topic: 767 Message: 767

All,

Due to the loss of the Arlington Convention Center (in Arlington, TX), Hamcom is moving to the Plano Centre in Plano, TX. The convention will be held on June 9 & 10, 2006. It's a good facility, but smaller, so there is much less classroom space. As programming director, I need to get a feel for what everyone wants to see so I can get my brain wrapped around how much space I can allot to each topic. If anybody has any suggestions, lets hear it!

768. Re: [ntms-hsmm] HSMM at Hamcom in 2006

Does the facility have WiFi available or will we have to wire it
ourselves like Arlington?

There are 141 members on this list, but no responses to my question
concerning what you might like to see for Hamcom '06. Last year we had:

Dallas D-Star - Jim McClellan, N5MIJ
HSMM: Packaging for Outdoor Use - Tony Campbell, W5ADC
HSMM: Using the Linksys WRT54G - John Beadles, N5OOM
Introduction to HSMM - John Beadles, N5OOM

Do we not need these again, or anything new? This is a good chance to
tell the programming director what you want.

OK, John since you asked...

I personally would like to hear any AARs with HAMs deploying after Katrina and Rita. What they deployed with, how they participated, what went wrong, what went right, lessons learned, would they do it again, etc. I don't know how we could fit something like that into the program but I for one would be very interested...

Mansfield ICP for Rita evacuation
--We had a problem sharing info regarding of evacuees, we weren't able to get Dallas County to route evacuees to Tarrant County in a timely manor, this resulted in several (in my opinion) traffic and logistics problems that could have been avoided, some of this was out of Dallas and Tarrant county hands.
Our EOC's need multi lingual personnel present because evacuees had problems understanding directions to shelter staging areas as it was not their native language, we no habla espaniol when needed.
Good Stuff-
Tarrant County EOC had great support and the Mansfield Comm (ICP for the event) center was brand new. Great Security in the building, tons of snacks (I think my cholesterol count went through the roof over the 2 day service period I worked the comm at the ICP)
Salvation Army personnel are the best of the best.
Great radios, they were prepared with 2 mtr and 440 at the time, hf hadn't had time to be installed at the time because the center was brand new.

John,

Oh, were you talking to me? :-)

One thing that hasn't been explored much is the performance of the wifi receivers. Like how susceptible they are to interference, do preamps help? Does additional transmit power help in the typical network? That sort of thing.

Bob

I would like to see a presentation from American Red Cross and Salvation Army about how they use HSMM in emergencies.

Maybe we could have the ARC van that was parked outside Ham-Com last year provide the internet connection for this year and we (our ham group) make the wireless connections to the interior of the building. This effort wold simulate an emergency control operation center

Is there wireless coverage already in the building?

I would be glad to give a presentation on HSMM in the Wild Ride 2005.

Andy, it helps if one knows that Andy Spano is a hack who was running his mouth off to get airtime immediately before THE ELECTIONS which took place in Westchester and the rest of NYS today. I suspect that he already knows Westchester County would have a hard time pre-empting the FCC's control over the use of radio devices.

Never underestimate the power of creepy political hacks to exceed their authority
and pass laws they have no business passing. Anyone who doesn't believe this
has never attempted to get municipal officials to abide by PRB-1 or any other
just restriction on their political power. I serve on the city council of the 10th largest
city in Texas and I am routinely amazed, on a daily basis, by the almost unlimited
capacity of crazy officials to execute bold and brazen power grabs, cynical attempts
on the public liberty, and outrageous raids on the public purse. From where I sit,
you had better keep your political powder dry for once one jurisdiction does something
really crazy, like outlaw open Wi-Fi APs, it can spread like gangrene and with
frightening speed to other jurisdictions! I'll be going to the National League of
Cities conference in December. If I hear that this lunatic notion is gaining any
traction I'll pass it on to the group.

Well,

New york has an Anti Hacking law that states access a
wireless network without the permission of the owener
is a crime, so let me see if I get this right.

The City IT department drove around and "Hacked", as
defined in NY State law, into 248 different Computer
networks.

Shouldnt there be legal actions taken agains the city
and its IT department for such actions?

.....

Hey Im of the mind that if you leave the AP Open with
no WEP & DHCP on then I should be considered a public
access point. That being one that is free to the
general public to use.
That does leave you open to Law suits from the RIAA
and others that beleive in the Sue the Customer
business model....

Ron

784. WiFi to Rescue Xmas Parade???

Yahoo group: DAWG-HSMM
Date: 2005-11-13 06:32:47 UTC
From: Douglas Kilgore
Topic: 784 Message: 784

Could a PDA with 802.11b solve this problem?

The Chamber of Commerce 2005 Richardson Christmas Parade will be held on Saturday morning, Dec. 3 forming at Richardson Square Mall in East Richardson. The Richardson Wireless Klub is providing communications support for the parade.

Each year the the parade is video taped for broadcast over local cable channel. A local broadcast announcer has volunteered to be the live on-screen voice reviewing each float as it passes the judging stand. The announcer must have accurate information on each float as it passes the judging stand.

Each entrant is supposed to have pre-registered filling out an data sheet. As the entrant checks in at the staging area the morning of the parade, they are assigned a position and given a numbered sign to post on their float. For the announcer a notebook is made up of each sheet in numerical order.

The difficulties occur when an un-registered entrant shows up or when changes are made in the VIP lineup leading the parade. It's usually in the minutes just before the parade starts. This information must be passed to the judging stand about 2 blocks away from the staging area.

In past years a ham with an HT has relayed changes by voice to another ham at the judging stand which in turn gave it to a volunteer feeding information to the announcer. Due to high ambient noise levels involved with bands playing, etc., this transfer has been difficult.

Also, after the parade starts, the number of each float turning onto the street is transmitted to the judging stand. This is because the entrants sometimes get out of numerical order. There is a delay of 5-7 minutes between the time an entrant turns onto the street and the time the entrant arrives at the judging stand.

So I was thinking that a pedestrian mobile ham equipped with a PDA with 802.11b could relay the digital data to the judging stand where an old dot matrix printer with fanfold paper would print out the data. We would create our own Local area network. We would operate under Part 15 rules.

We have available the printer, a Linksys wireless print server, and multiple APs.

So...
1. WHO has a PDA equipped with 802.11b and would be willing to help?
2. What software would allow line by line text transfer?

3. Would the PDA power last for 4-5 hours of operation?

What else am I forgetting?

Suggestions please!

Just use a car charger cord and a gel-cell, should be no problem.
Might be able to borrow the PDA from KC5QHH. I sold him an old Ipaq,
and he has outfitted it with Wifi, weatherproof case and all that.

I've got a fully equipped HP Ipaq with lighter plug adapter -- I just need a battery with powerpoles on it -- I have the Powerpole to Lighter Socket adapter

I also have a laptop with wireless -- either would do the job for 4-5 hours even on their internal batteries

If the software to handle the printer int line mode doesnt exist -- I have all the tools to develop programs for the IPAQ and have written apps that talk to line-mode ticket printers -- so thats no problem either

I'll need the print server and a line printer to get started testing a solution

787. NYC Violating State Law? Parish the Thought!

Yahoo group: DAWG-HSMM
Date: 2005-11-14 16:14:53 UTC
From: Randall Dunning
Topic: 787 Message: 787

Ron insightfully asks the question:

"Shouldnt [sic] there be legal actions taken agains [sic]
the city and its IT department for such actions?"

The answer? You would think YES but the real answer is likely NO.

Why? Simple! Government entities usually exempt themselves
and other governmental entities from any aspect of a new law
that is too expensive, time consuming, or personnel intensive.
Now, it is too too bad if you find compliance expensive, time
consuming, or personnel intensive. After all, government at all
levels passed over 100,000 laws, ordinances, statutes, and regulations
last year and you are accountable for all of them. (What, you don't
find the old saw "Ignorance of the Law is no excuse." comforting any
more? Neither do I) Since the New Deal we have pretty much become
slaves with the government as master rather than the other way
around. (I guess that was the "New" part of the "Deal".)

I would check that New York law again for existence of a clause
exempting government entities and agencies from prosecution.
Dollars to donuts it is either directly in the statute or part of
the overall chapter and/or subchapter in which the statute dwells.
Even if it is not explicitely there, there is this srange presumption
of purity that all governments claim and accord each other. Basically
the assumption is that government motives are always good even if
the execution produces really awful results. The technical term here
is "sovereign immunity". (Uh, I thought We the People were sovereign.
Silly me!)

Yes it stinks of hypocrisy but until people wake up and realize
what is being done to them little will change. And the flamers who
always rise up on these groups shrieking: Keep politics out of our
precious group! don't make things any better. I like a play on the
words of Trotsky that goes: "You may not be interested in government,
but government can be very interested in you." I would add that
when government becomes "very interested in you" or any of your vital
interests, you have had a bad day, a very very bad day.

Government is becoming VERY interested in WiFi so expect more and
not less insertion of the government camel's nose under our tent. I
suspect we Part 97 guys will take it in the chest when that happens.

RD - KC5QHH
2 Term Council Member - City of Garland, District 8

"We are fast approaching the stage of the ultimate inversion: the stage where the government is free to do anything it pleases, while the citizens may act only by permission; which is the stage of the darkest periods of human history, the stage of rule by brute force."
~ Ayn Rand, The Nature of Government

P.S. I have caught my own city doing things that I was sure were not only wrong but illegal. Council members and staff will spin and dodge and massage the facts such that even an "insider" has a herculean task attempting to get wrongs acknowledged, let alone righted.

Let's give it a try. It will be fun to try something new.

I will be attending a monthly meeting of the Richardson Wireless Klub tonight (Monday) 7:00pm at St. Barnabas Presbyterian Church, 1220 West Beltline in Richardson. You are invited to attend. I can bring the equipment and battery.

Please send me your phone number so we can get together.

I wont need the battery until the actual event -- just the print server and printer

I have an AP here at the house, though if the print server supports it, we might want to try an adhoc peer to peer network if we can get a good signal at the distances required (2 blocks shouldnt be a problem with a free space path, or hang a beam on it)

What is the cross street for the church ??

Uh, guys? If you're talking about the WESTCHESTER COUNTY WiFi scans, that's not in New York City. Now that Rudy "El Faciste" Giuliani is out, there's talk about NYC rejoining the Union and following the Constitution again.

791. WiFi Scans

Not sure if this would suffice for the printing of the information, but something like 'sticky notes' may work and just print individual notes off. I don't have a CE device, so can't vouch for the functionality, but here is a link to some programs that may work.

It seems to me that when you run it open and unsecured, you are granting permission to everyone who is so inclined to make use of it. This does not excuse malicious attacks - - but only the invited use, as stated.

I think there are real opportunities for ham radio with the use of the technology for local intranets, where ham licenses are required to transmit and 'check in.' Others will see them as they scan around and come to learn how easy it is to get a ham license. We'll see articles on this in computer magazines, and discussion at meetings of computer user groups like this one: http://www.ntpcug.org

BTW, Today there's news about Houston and Muni Wi-Fi:

This is interesting thread. I work for a WISP in rural NE Texas. I have to agree with Tom about the open access 'gentleman's agreement'. The original idea of WiFi is for shared open access, of which I contribute my little bit of bandwidth at home for the neighborhood via firewall/router, but if New York outlaws this type of thinking, then it is my opinion that all equipment found open should be shut-down and taken. (Similar to radar detectors in most states)

Remember, WiFi operators are using Ham Radio Frequencies, therefore, probably causing some type of interference. If I left this system at work open for others to access, 'hack', that's puts me in the position to contribute to the delinquency.

I realize that in NE Texas we don't have a lot of people trying to hack our local WiFi networks. Just the presence in town would be noticed by those around here who don't like 'outsiders'. The law would run you off and chances of breaking 128k bit encryptions in the time frame needed to do so would be thwarted quickly by the local concealed permit or shotgun toting neighbor. hi.

The article on Houston's attempt at WiFi sound great. I usually check KHOU.com website daily for news from that area of Texas. Here in Paris, Our local police and EMS have acquired wireless equipment and my company has given them access to our access points for testing with their servers. All through VPN access of course.

I hope Houston's project goes ok.

Leo, N5JEP
Paris, TX

Hi Johnny -
Check out http://www.fab-corp.com/ They are hams and give a discount
to hams if you mention your callsign. Look at their starter packages.

Did you try putting the AP in a weatherproof box on the antenna and use
power-over-ethernet on CAT-5 cable up to the box. You may have to up
the power voltage to compensate for resistance drop in the CAT-5 wire.
See http://www.gweep.net/%7Esfoskett/tech/poecalc.html

I'll send you a couple of pictures showing what we have been using.

<<It seems to me that when you run it open and unsecured, you are granting permission to everyone who is so inclined to make use of it.>>

Which is why in NYS most jurisdictions call it "fourth class tresspass" and a violation (like a jaywalking ticket) if you are found on someone's lawn and the lawn is not fenced or posted. Add a fence, or posted notices, and the violation becomes a misdemeanor and soon you spend the night in jail.

The laws are even simpler for WiFi. What you and I might think of "Gee lookit this" is IIRC now defined as federal computer tampering and/or theft of services even when there are no state or local laws dealing with it.

If you see a car in the street with the windows down and the keys in it, you probably know it wasn't just left there for you, and you expect to get slammed if you use it. And, the folks who left the key in it are arguably stupid to do so, in this day and age. Which is part of why most states make it illegal now to leave you keys in your car ignition, and why cars HAVE ignition keys to begin with. Them nice gum'mint boys made laws, to protect those who are too dumb to do it themselves--and the rest of us, from the collateral damage they cause.

Same thing with WiFi. Just because some idiot set it up without reading the fine manual, doesn't mean there is any reason for you to expect it is there for your use. If they leave it open and rename the network "PUBLIC_ACCESS" that's something else again.

But you know *perfectly* well, that borrowing someone's WiFi and borrowing their car are exactly the same thing. Might as well borrow the couch, the wife, the master bedroom, whatever else is unlocked at the same time, right? You sure about that?

Or maybe, you'd prefer more "help" from the gum'mint on this? Like Westchester wants to give?

<<Remember, WiFi operators are using Ham Radio Frequencies,>>

I don't think so. AFAIK 802.11a/b/g WiFi uses the ISM (Industrial, Scientific, Medical) frequencies which are NOT ham radio frequencies. As ham operators we are allowed to *share* them with everyone else--but they were not given to hams. We're just required to play nice, with everyone else in the same sand box. And we're allowed to use the big toys (boosters and antennas) because in theory we know better than to use them on the other kids.<G>

Johnny-
What Doug said. Running long cables to an outside antenna is pretty much guaranteed to be a waste of time. The loss in the cables is measured in decibels (db) per so-many-feet per frequency. If you look at the loss per foot at 2.4GHz (WiFi frequency) and add up for 50 feet, it may be larger than the gain provided by your antenna. It will certainly be significant.

On the other hand, there is no effective loss over an ethernet cable running 50 feet, so putting the entire WiFi box (router) outdoors in a weatherproof box gives you full performance. And probably won't be any more expensive.

I'm not sure what planet you are on, but those clearly on not the same thing. A simple check with police officer or lawyer will confirm this.

Now, this is a morals issue, and as such there is likely no cut and dried answer. If I leave my wifi access point at home open, and you connect to it, specifically which crime have you committed? If I turn on a 100mxw FM transmitter and play music, and you listen to it from your house across the street, are you stealing my radio signal? If I play commercial music on that transmitter to listen to in my home, and you pick it up across the street, are you going to be required to pay ASCAP and BMI for the royalties on that music? Your logic argument is flawed.

As far as borrowing the neighbors wife, find me one wife that thinks there is NO difference in her husband 'borrowing the neighbors wife' and 'borrowing the neighbors wifi' and I'll want to meet her.

Hi Johnny,

JEFA Tech makes them. Check out this link:

http://www.jefatech.com/product/ll400

If you just need an extension cable, choose RP-TNC for one end and
RP-TNC Female for the other.

Use promotion code HSMM at checkout for a 10% discount.

JEFA Tech is also owned and operated by HAMs.

Thanks!

A portion of the 802.11a/b/g channels are within the Ham Band.
Only channels 1-6 in the case of b&g are within the Amateur 2.4 GHz band.

And 802.11a uses the "Unlicensed National Information Infrastructure" band, which only overlaps the ham band on the upper 4 channels. The UNII band has its' own discussion in the Part 15 rules.

On the back? That'd be unusual. Can you take a picture and send it to me directly? I'm sure I can identify it.

Usually most of the internal cards are MiniPCI under the keyboard/in the laptop using Hirose U.FL connectors that connect to a small antenna around the LCD screen (in most cases).

6 & 12 " pigtails with 1.3mm (very small) coax can convert this almost flea sized sized connector easily to RP-SMA for example from off the shelf stuff - then you have a connector a bit more "workable" for using in this scenario (well at least, I keep them on the shelf).

Let me know on the connector, I'll get you the info you need.

Are you sure that's a wifi connector? I figured it was power for the
docking station. The SCSG just bought a toughbook, and I love it...
only problem is what we run xastir, and we have people who just LOVE to
touch the screen when they point at something, and inevitably the map
will zoom in on some small portion of the map delaying our conversation.

>only problem is what we run xastir, and we have people
>who just LOVE to touch the screen when they point at
>something, and inevitably the map will zoom in on some
>small portion of the map delaying our conversation.

Tis why I asked for a pic of it from him :)

I have seen a Fujitsu that -did- have a MMCX on the back, only sold in Japan once and also a OEM unit that had a u.fl under a trap door.

I haven't used one of the new toughbooks, I know on my Lifebook, with touchscreen, I have the same problem when demo'ing APRS :) Ham's can't seem to keep their fingers off the screen when they see their callsign <grin>.

Daron-

<I'm not sure what planet you are on, but those clearly on not the same thing. A simple check with police officer or lawyer will confirm this.>
How strange. On my home planet, police offcers are taught and trained to know that they are not lawyers. They are famous for NOT knowing the details of "the law" but rather for the criminal and administrative codes they enforce. And, as most of the lawyers will tell you, these are not MY views. They are the standards drawn and upheld by the courts in the US to date. You may disagree with them, because laws do change and not infrequently they ever reverse.

Nonetheless, the law today says that if you use some "service" that is not yours, that's specifically called "theft of service" no matter how you claim you found it. "Well, officer, I found this electric socket and it was LIVE so I decided to plug my car in and recharge it..." Uhuh.<G>

<<If I leave my wifi access point at home open, and you connect to it,>>
Yeah, but there's a federal computer tampering law covering that. Your state doesn't even get a vote in the matter, unless they do it through Congress now. Merely *connecting* and logging into a system which you do not have permission to enter, is a crime. Why or how you did it, is only an issue for the court to consider while they're passing sentence.

I never said that was my view, or that I agreed with it. Challenge the courts at your own peril. If you win, you're a patriot. If you lose, don't worry, pretty much everyplace except, what is it, Maracopa County? allows the inmates to use computers.

Your analogies to broadcasts and commercial music would be interesting--except, they're also covered by specific laws that have been worked out over the years. "Broadcasting" is a 1-way activity. Logging into someone else's computer and using their bandwidth (and by extension, using their identity since their ISP has contracted for them alone to use it), is a whole other kettle of fish.

<<are you going to be required to pay ASCAP and BMI for the royalties on that music?>>
Those royalty agreements--upheld by the courts--allow for audio listening. But in case you haven't heard, internet radio is fighting hard to stay alive because commercial music "broadcast" on the internet often has to pay steeper royalties than a local clear channel station would pay.

If you want a world without such legal encumbrances, try Red China, the former Yugoslavia, Romania, or the former USSR, all places where intellectual property was ruled to belong to ALL of the people and the courts allow many kinds of "borrowing". Including organs from some prisoners. Hmmm....

From: Linden, Jerome <jlinden@...>
To: <jrlinden@...>

I am sending the attached sheets to those who have shown an interest in the laser inventory I recently acquired. I promise to have more soon but it will give you a little more fact.

For sale: 17 Ghz laser transmitters and receivers, 350 mhz bandwidth, 3500 ft range. 50 millwatt laser diode. Originally manufactured for MATV distribution. Compact and efficient laser collimators. Many partially build units, several out of the box ready. Ending inventory of bankrupt company. I will soon have most equipment and schematics on web site but I suspect that most interest there, will be the 17 Ghz equipment, oscillators, splitters, combiners, mixers, etc. For this group it may only be the laser itself, which is cute but dangerous. SERIOUS questions and buyers only. Tnx

Dave,
Well, the internal card is an Intel Pro/Wireless 2200BG.
The info on this is available on the web in many places.
I can't determine which connectors are on the card, but that would be a
second choice since I would need to run a cable up and around the display.
From there I could put a connector on top of the display on an existing
mounting point.
I say it would be my second choice because there is an existing connector,
though of unknown type, on the back.
I can't find my USB cable for my camera...I think my son has it.
In the meantime, any ideas on the connector on the rear apron.
Thanks!
Gordon Beattie

>antenna in the
>2.4 Ham band.

On the back? That'd be unusual. Can you take a picture and send it to me
directly? I'm sure I can identify it.

Usually most of the internal cards are MiniPCI under the keyboard/in the
laptop using Hirose U.FL connectors that connect to a small antenna around
the LCD screen (in most cases).

6 & 12 " pigtails with 1.3mm (very small) coax can convert this almost flea
sized sized connector easily to RP-SMA for example from off the shelf stuff
- then you have a connector a bit more "workable" for using in this scenario
(well at least, I keep them on the shelf).

Let me know on the connector, I'll get you the info you need.

Seeya,
Dave

Hi Folks!
I went looking for a picture of the rear of the CF-29. I couldn't find one, except one of the rear panel where everything was labeled except the WiFi connector...figures!
As a consolation, I found the photo of the earlier CF-34 model with the AK-47 round through it.
It still runs, but needs an external display and keyboard (wonder why?) and it is rumored to be on display in Panasonic's offices in Secaucus, NJ.
Thanks!
Gordon

My best guess, based on some of the photos I see on the web is that this is not a WI-FI antenna connector.

The Intel card has U.FL conectors on the card directly, so if you wanted external access,you'd have to do what I did to my laptop and put a pigtail on it.

Now if the particular laptop you have is a different than the photo's ive seen, it's possible there is a internal pigtal that does this, but I've not seen any "us" market sold units with that.

Dave and Wes,
Thanks for your comments and pictures.
It really is the WiFi connector because it allows the docking station to use an external antenna.
I'll open the unit up again and see how I might route a replacement cable assembly.
Thanks!
Gordon

From: John Barrett
Topic: 784 Message: 819

I'm having a real problem with the WPS11 dropping the wifi connection because my AP is half way across the house and the tiny antenna on the WPS just isnt up to the job.....

Can we arrange to get me an antenna with some gain to alleviate this problem ??

In fact -- I'm far enough along at this point to start working with the actual AP that we will use on site

We will need to pick an SSID and channel to operate on also.... Is someone available that can perform a site survey ?? Or I can pop over there with my PDA and see what nets we will be competing with

John,
Try using a program called "NetStumbler" to seek out other networks in your target area.
It captures all the information on each network in an area including SSIDs, MAC addesses, etc.

Subject: Re: [ntms-hsmm] WiFi to Rescue Xmas Parade???

I'm having a real problem with the WPS11 dropping the wifi connection because my AP is half way across the house and the tiny antenna on the WPS just isnt up to the job.....

Can we arrange to get me an antenna with some gain to alleviate this problem

??

In fact -- I'm far enough along at this point to start working with the actual AP that we will use on site

We will need to pick an SSID and channel to operate on also.... Is someone available that can perform a site survey ?? Or I can pop over there with my PDA and see what nets we will be competing with

I have the one of the APs that we will be working with that I can bring
to your house. Please call me at 972-231-8539.

Let's take all of the coodinating messages off of the reflector. Use my
email address douglas.kilgore@...

I've heard about NetStumbler -- and its overkill for checking out available APs in a single location -- any laptop/pda with a wifi browser is more than adequate for this job

823. Net Stumbler map

Yahoo group: DAWG-HSMM
Date: 2005-11-24 21:27:09 UTC
From: Leo Salas, N5JEP
Topic: 823 Message: 823

I have recently taken a GPS with me at work and drove around a while collecting data with Net Stumbler. What do I need to do to convert this information to a Map, say Delorme Street Atlas 2003, or Topo USA v4? or maybe even Google Earth?

Leo, N5JEP

You can use WiMap the free utility to convert Netstumbler files to Lat/Lon and draw objects for use in Street Atlas. Here's the URL:

http://www.honet.com/WiMap/

For MapPoint you can use StumVerter by Michael Puchol. It can be found here:

http://cit.stcc.edu/resources/OpenSourceTools/Stumverter/?C=D&O=A

Sure thing. You will need MapPoint from Microsoft to make it work.
Here's the URL:

http://www.microsoft.com/mappoint/default.mspx

I am not sure of the price. My copy came as part of MAPS (Microsoft
Action Pack Subscription) which is a ton of MSFT software bundled for
members of their partner program.

EDIT- I just looked up the price. 299 USD. Yikes.

It's my understanding that StumVerter will not work for MS Streets and
Trips. But I believe that I have seen a script or scripts on the
Netstumbler forum that will work for S&T.

My personal preference is the older Delorme Street Atlas series. Their
newer user interface requires too much mousing, IMHO, and doesn't
support keyboard shortcuts (the ALT+ keys). WiMap works with most
versions of Street Atlas. See the site for compatibility details.

BTW, Brent Hildebrand's APRS+SA for packet only works with the older
versions of SA. The software named in years (2003, 2004, etc.)won't work.

Addendum to my last post.

I just waded through the Microsoft EULA and it seems that I am allowed to produce a map (actually, less that 250) and not charge a fee. This will keep me out of trouble with the Redmond Legal Team.

The map for the Cortez area is only 16kb in size. I could email it as an attachment if you want to play around with StumVerter.

You can use WiMap the free utility to convert Netstumbler files to
Lat/Lon and draw objects for use in Street Atlas. Here's the URL:

http://www.honet.com/WiMap/

For MapPoint you can use StumVerter by Michael Puchol. It can be found
here:

http://cit.stcc.edu/resources/OpenSourceTools/Stumverter/?C=D&O=A

APRSPoint is a complete APRS package with integrated street-level maps.
We are offerring a thanksgiving special. Now you can APRSPoint license
plus MapPoint 2004 for $88.95 instead of $109.95. Please visit
http://www.aprspoint.com/ for details. Thanks.

833. Hawking 7dbi antennas

Yahoo group: DAWG-HSMM
Date: 2005-11-26 02:59:02 UTC
From: Joe Jurecka
Topic: 833 Message: 833

FYI,
Down in Houston this morning, Micro Center had 7dBI Hawking antennas free after rebate (well, you have to pay tax on $25 and a stamp or two), but overall not a bad price. Comes with both RP-SMA and RP-TNC adaptre. The Richardson store may very well have stock as well.
73,
Joe

> after rebate

Here, they are $17.99 at the register plus tax (almost $20) for a net price of $9-10 after the $10 rebate, and that's for the older 6db antennas. The new ones claim 7db, not on sale. Removing the generous but cheap (high loss) cable, or shortening it to 6", could probably yield another full db of gain.

Does anyone know if the antenna "shell" is welded shut, or can pop open without damage? Easier to shorten it from the inside end.

CHECK YOUR PAPERWORK, MICROCENTER IS PLAYING CUTE. Their store-generated rebate forms were expired 10/31 and the current form is different. It can be downloaded from their web site--but the download won't display correctly unless you have the latest version of Acrobat installed. (And there's no excuse for that, Acrobat still can produce backwards-compatible files with no extra effort.)

The new/old forms have different box numbers as well as date limits.

846. Antennas & Stuff

Yahoo group: DAWG-HSMM
Date: 2005-12-01 17:06:05 UTC
From: J. Beadles
Topic: 846 Message: 846

I don't think we've discussed this on the net recently, so I thought I'd throw it out:

Kent Britain, WA5VJB, a long time member of the North Texas Microwave Society, manufactures a line of PCB antennas, including several in the 2.4GHz range. These are bare, coated PCB boards to which you must attach your own feedline.

For 2.4GHz, he has two patch antennas (1 with 2 patches, the other with 4) and a small yagi antenna. These boards go for less than $10. Kent attends many of NTMS events, and sells at Hamcom. If you are in the Dallas area, Tanner Electronics carries his antenna line.

Also, here's another review of that Hawking 802.11b amplifier that was out earlier this year:

http://reviews.cnet.com/Hawking_HSB1_Wireless_Signal_Booster/4514-6461_7-31126286.html

Hi Folks!

Anyone know of a USB based 802.11b/g adapter that is decent and can be used
with an external antenna?

My objective is to use it as a Ham Radio device in the 2.4 GHz band.

A quick Google search for "usb 802.11 external antenna" turned up many
hits. One of the more promising hits was:
http://www.netgate.com/product_info.php?products_id=297

I hope this helps.

<<http://www.netgate.com/product_info.php?products_id=297>>

ROFL! At that price, you can buy two whole Linksys 54G routers and start building your own relay network. Looks like that site caters to the "marine yachting" market where price is no object.

And, the 200mW output is fully twice the maximum rated output for the 8.5db gain "marine" grade antenna they recommend using with it. What a rip.

uhhhh... read the antenna specifications more carefully next time..

"Maximum Power Input: 100 W"

which would be 100,000 mW

851. Source for Hirose MS-156 Plug

Yahoo group: DAWG-HSMM
Date: 2005-12-26 16:34:15 UTC
From: Phil Williams
Topic: 851 Message: 851

I have a couple of 802.11 a/b/g cards that use the Hirose (www.horise.com)MS-156 receptacle. I am in need of source for the mating plug. Any of the part number would do:

MS-156-C(LP)-2

MS-156-HRMJ-2

Link for the spec sheet view here:
http://www.hirose.co.jp/cataloge_hp/e35801678.pdf

Thanks,

Phil, KA1GMN

What are the make and model of the cards ? Have you tried Mouser or Digikey
?

Are you trying to make a patch cable, if so check www.wlanparts.com

I need to fabricate a pigtail to go to SMA female. Make, model, and
FCC ID is as follows:'

Make: Belkin
Model: F6D3010
FCC ID: K75-F6D3010

I have pictures of the card and its connector. I will post the links to
these photos shortly.

854. Re: [ntms-hsmm] Source for Hirose MS-156 Plug

Yahoo group: DAWG-HSMM
Date: 2005-12-26 23:34:40 UTC
From: Phil Williams
Topic: 851 Message: 854

I uploaded two photos of the card and receptacle. Here are the links:

http://pg.photos.yahoo.com/ph/rci2000@.../detail?.dir=/fe90&.dnm=a5fbre2.jpg&.src=ph

Note: The receptacle is on the lower left had side of the card and is
in line with one of the antennas.

http://pg.photos.yahoo.com/ph/rci2000@.../detail?.dir=/fe90&.dnm=9e6bre2.jpg&.src=ph

Note: A better close-up of the receptacle - located in lower half of
photo. This is a a combination switch/receptacle. When the plug is
inserted, the antenna is taken out of the circuit. This receptacle is
designed for assembly line testing, so it has a very low insertion
life-cycle. What method one would come up with to adapt this connection
out to a some more common connector would have to be permanent.

I have searched through Digi-Key and www.wlanparts but no joy.

Phil,

That connector looks VERY SIMILAR to the one I can't identify on the back of my Panasonic Toughbook 29.

Any measurements?

Sorry to say that I have never examined the Toughbook 29. Do you have a photo of the receptacle in question?

I have this receptacle on a Belkin F6D3010 Client card. The spec for the receptacle can be found at:

http://www.hirose.co.jp/cataloge_hp/e35801678.pdf

This pdf file show the dimensions of the receptacle on page 4. Mating plugs and SMA adapters for this receptacle can be seen on page 6. I have seen these on Dlink DWL-650 and Cisco a/b/g cards too.

858. RE: [ntms-hsmm] Source for Hirose MS-156 Plug

Yahoo group: DAWG-HSMM
Date: 2005-12-27 09:51:14 UTC
From: J. Gordon Beattie, Jr., W2TTT
Topic: 851 Message: 858

Phil,

Here is a URL for a write-up that includes a couple of photos.

Look at the photo of the rear panel and you'll see a small round coaxial connector to the left of the multi-pin docking connector.

http://images.google.com/imgres?imgurl=http://www.pencomputing.com/images/panasonic_cf29_back.jpg
<http://images.google.com/imgres?imgurl=http://www.pencomputing.com/images/panasonic_cf29_back.jpg&imgrefurl=http://www.pencomputing.com/frames/textblock_panasonic_cf29.html&h=117&w=500&sz=23&tbnid=0s6sA-IwxjYJ:&tbnh=29&tbnw=127&hl=en&start=223&prev=/images%3Fq%3Dtoughbook%2B29%26start%3D220%26svnum%3D10%26hl%3Den%26lr%3D%26rls%3DSUNA,SUNA:2005-48,SUNA:en%26sa%3DN>
&imgrefurl=http://www.pencomputing.com/frames/textblock_panasonic_cf29.html&h=117&w=500&sz=23&tbnid=0s6sA-IwxjYJ:&tbnh=29&tbnw=127&hl=en&start=223&prev=/images%3Fq%3Dtoughbook%2B29%26start%3D220%26svnum%3D10%26hl%3Den%26lr%3D%26rls%3DSUNA,SUNA:2005-48,SUNA:en%26sa%3DN

The connector on the rear of the computer seems to have a center pin (male).

At one point I thought it was an RP-MMCX connector, but that was too big!

This connector you referenced seems to be a possibility.

What do you think?

How do we get some samples to check out?

Sorry to say that I have never examined the Toughbook 29. Do you have a photo of the receptacle in question?

I have this receptacle on a Belkin F6D3010 Client card. The spec for the receptacle can be found at:

http://www.hirose.co.jp/cataloge_hp/e35801678.pdf

This pdf file show the dimensions of the receptacle on page 4. Mating plugs and SMA adapters for this receptacle can be seen on page 6. I have seen these on Dlink DWL-650 and Cisco a/b/g cards too.

I see the connector you are refering to but it is hard to make out the details. Is there anyway that you can get a close up photo of the receptacle?

862. OT: TCP/IP over AX.25

Yahoo group: DAWG-HSMM
Date: 2006-01-07 11:54:30 UTC
From: Thorsten von Eicken
Topic: 851 Message: 862

This is a little off-topic, but maybe someone can send me a quick pointer. I'm trying to understand how TCP/IP over packet networks work, i.e., how IP is encapsulated in AX.25 and how the layer 2 forwarding is done. I'm finding lots of information on how to configure this and that software package, but no "protocol specification" or similar. Any pointers very much appreciated!
Thorsten

There are a few places to start.

The current JNOS page is a good place to start.
http://www.langelaar.net/projects/jnos2/index2.html

You can also find some usefull nuggets of information in the Linux AX25
Howto
http://www.faqs.org/docs/Linux-HOWTO/AX25-HOWTO.html

Here is a version of the protocol doc for AX25 Packet
http://www.qsl.net/oe8djk/pr4ax25.html

Hope this gets you started.

AX.25 Amateur Packet-Radio Link-Layer Protocol

http://www.tapr.org/pub_ax25.html
Special emphasis on paragraph 2.2.4, □PID Field□. Used to identify what upper layer protocol (IP) was contained withing the protocol data unit of the AX.25 frame.
Phil Karn KA9Q □ One of the first PC based implementations of TCP/IP over AX.25. Phil's original NOC TCP/IP package contains excellent reference material.
http://www.ka9q.net/code/ka9qnos/

The KISS protocol allowed PCs to talk directly to terminal node controllers (TNCs) and bypass the TNC software. Facilitated the development of TCP/IP over AX.25.
http://people.qualcomm.com/karn/papers/kiss.html

De Phil, KA1GMN

From: J. Beadles
Topic: 866 Message: 866

Not much traffic in the past few months. If you are like me, you are fighting winter apathy. Here in Collin County a few of us are working on a Winlink/Telpac installation in the Wiley area, and working with KD5OUG to decide on whether to do another HSMM project for the '06 Wild Ride.

Anybody else got any HSMM projects going?

867. Congradulations Joel!

Topic: 866 Message: 868

Don't know if this qualifies fully, but about three weeks ago I was able to establish a link from Downtown Paris to W5LL in Brookston about 8 miles on 2.4 GHz using Karlnet firmware to feed an 802.11b Access Point.

The APs that are on the local hospital have excellent range across the area in nearly all directions. The AP is at 768ft MSL or 168 feet above ground level on the top of our Hospital. It's location is also listed on the Google earth's IRLP list as node 3386 N4RAP and Echolink N4RAP-L. The IRLP and Echolink nodes use this AP for Internet access via 802.11b client bridge (Senao CB-3 Deluxe and Rootenna using POE at 40 ft) about 2 blocks north of the hospital.

Also have prospective AP locations near the Paris airport, and Clarksville airport for both locals and hams to use. We (Star~NET Online Systems) have setup 7 AP's in Powderly, 2 in Blossom, and 20 in Paris proper (17 of which are at Paris Junior College) for use by locals and also hams and emergency personnel.

Your probably asking why so many at PJC? Well, the dorm rooms are made like Alcatraz Prison. 18 inch thick walls and two floors with two wings.

Although the system is technically running under part 15, it's a start!

The system boasts a develepment version of the Asterisk phone server which I have yet to dive into. That day will come soon. Another ham in the networking business in this area already has an Asterisk server running for a local business and has setup several Motorola Canopy links. Looking forward to some elmering on this subject.

I have some questions about the old Heartland TV 2.3/2.4Hz? Parabolic Antennas. Anyone tried to use on on 2.4 for and AP or Client Bridge? Other than the down converter having to be scrapped, any suggestion on how to properly measure the distance of the radiator from the parabolic reflector?

I just got an email from Doug Loughmiller, W5BL, about a balloon launch being planned for Clarksville, Texas. My company is going to proved an local AP on 802.11b that has a completley wireless internet link to Paris via 5.8GHz. I'm interested to see just how far this balloon will go. Heard some really good distances acheived in Oklahoma and Kansas launches.

869. $99 2.4GHz Spectrum Analyser

Yahoo group: DAWG-HSMM
Date: 2006-02-09 04:20:08 UTC
From: J. Beadles
Topic: 869 Message: 869

Ok, this is pretty neat. The WiSpy is a 2.4GHz receiver in a USB dongle, with associated software for $99.

An even better and cheaper solution is to deploy the WiSpy tools that are
now available from the Kismet Team.

From: Paul Pescitelli
Topic: 871 Message: 872

Yes, it requires Linux... I have multiple hard drives that I exchange in my laptop depending on what functionality I need for a given task, ie. one for Windows for Telpac, and one for Linux that is setup specifically for Kismet and Wireless LAN analysis.

874. Article on Communications Failures - VOIP Shines

Yahoo group: DAWG-HSMM
Date: 2006-02-17 14:42:56 UTC
From: Douglas Kilgore
Topic: 874 Message: 874

From the ARES E-Letter of February 15, 2006

+ Government Perspective of Communication Failures Not to Be Missed

The article "Missed Signals" appears in this month's issue of "Government Executive Magazine." It should be required reading for anyone involved in emergency communications, but especially ARES leaders. We can't help solve the problems faced by our served agencies until we understand them. See <http://www.govexec.com/features/0206-01/0206-01s2.htm> -- Les Rayburn, N1LF, ARES, SHARES, SKYWARN, ARRL EmComm Level 3 Certified, Official Emergency Station

875. HSMM Programming at Hamcom 2006

Yahoo group: DAWG-HSMM
Date: 2006-02-17 15:19:12 UTC
From: J. Beadles
Topic: 875 Message: 875

It's time for me to be putting together the HSMM presentations for Hamcom 2006. Hamcom is being held in Plano, TX, on June 9 and 10. Is anybody on the list interested in having any HSMM presentations?

Based on comments generated on this list last November, I am looking for volunteers for the following:

1. Use of HSMM (networking) by the Red Cross, Salvation Army
2. WiFi radio performance
3. Basic TCP/IP networking
4. More D/FW D-Star

So far, I have:

Introduction to HSMM - John Beadles, N5OOM
Possibly HSMM at 2005 Wild Ride (Doug, you still up for doing this?)

Last year, we had:

Dallas D-Star - Jim McClellan, N5MU
HSMM: Packaging for Outdoor Use - Tony Campbell, W5ADC
HSMM: Using the Linksys WRT54G - John Beadles, N5OOM
Introduction to HSMM - John Beadles, N5OOM

Anybody want anything else I'm missing? At this time, I'm not planning on doing the "Using the linksys WRT54G" program until somebody asks for it. I'll ask Tony if he wants to redo the "Packaging for Outdoor Use" presentation.

876. RE: [ntms-hsmm] Rootenna article Nit-picking time...

I noticed the following minor error in your article..

The I sat the circuit board on the nylon standoffs and secured the circuit board to the cable tie mounts with small cable ties.

I believe 'The' should be 'Then'.

Pardon the editor in me.

BTW, I would like to visit one of your activities when the system is in use. Any anticipated dates and locations would be appreciated.

Subject: [ntms-hsmm] Rootenna article

I finally finished this article on our flexible rootenna design. I'd appreciate any editorial comments.

878. 2006 Wild Ride

Yahoo group: DAWG-HSMM
Date: 2006-02-17 15:57:17 UTC
From: J. Beadles
Topic: 878 Message: 878

The 3rd annual Richardson Wild Ride bicycle rally on Saturday, May 20, 2006. For the third time, we'd like to use this event as an HSMM practice event. The purpose of this activity is to provide technology training and operating practice to hams using HSMM equipment for similar activities. This simulates setting up ad-hoc networks in the field for emergency response events.

The event has one start-stop location and 4 rest stops. What we've done in the past is to provide 802.11 connections to these rest stops. Due to changes in the availability of certain facilities, we may not be able to do this. So, this year I'd like to integrate multiple methods including 802.11, D-Star, Winlink, APRS and anything else anyone can think of.

In years past, we've experimented with webcams and netmeeting. This year, I'd like to:

- Practice with winlink email transmission, both over VHF and over 802.11, D-Star links
- Attempt to make certain webcam methods more reliable
- Solidify & demonstrate message handling practice between the nest control and the rest stops

For those who are interested, I'm expecting to run some sessions in advance to drill with using the tools and message practice.

I'll be managing the HSMM activty for Doug Kilgore, KD5OUG, who will be managing ham participation as a whole. Anybody interested should contact me either on this list or at n5oom@....

882. Wild Ride Bike Rally 2006 - May 20

Yahoo group: DAWG-HSMM
Date: 2006-02-21 05:06:03 UTC
From: Douglas Kilgore
Topic: 882 Message: 882

Put this date on your calendar!! Saturday, May 20, 2006

That's the date of the Richardson Regional Medical Center's 2006 Wild Ride Bike Rally. The route of this 62 mile rally will leave from Richardson, travel northeast over Lake Lavon dam to Josephine, TX and then return.

Ham operators are needed for supply wagons, rest stops, SAG wagons and rovers. Due to the distances involved, radios with minimum of 25 watts VHF and a good antenna are needed. Hams with APRS in a truck that can be used for a SAG wagon would be especially valuable.

Again this year we will use High Speed MultiMedia (HSMM) to upload webcam and digital still pictures to a internet web site on a near realtime basis. In addition to 802.11b, we expect to experiment with D-STAR and other digital modes. The digital camera photographer does not have to be a licensed ham so an unlicensed family member could fill that position.

Please volunteer early to take part in the planning and necessary training. Contact Doug Kilgore KD5OUG (kd5oug@...) or Ph 972-231-8539 Richardson Wireless Klub

Will somebody be taking pics of the training sessions?
We'd like to publish them, or at least post them on web pages.

Thanks,
John - K8OCL

886. Some progress with the NSLU2

Yahoo group: DAWG-HSMM
Date: 2006-03-08 15:41:52 UTC
From: J. Beadles
Topic: 886 Message: 886

It appears that somebody is making progress using the NSLU2. The NSLU2 is a Linksys USB network appliance. That is, you connect USB hard drives to it, and it publishes them on the local ethernet network. The NSLU2 is particularly interesting because it runs on Linux and has internal hardware for a serial connection.

On another list, WA7NWP provides a link to http://www.wetnet.net/, which has a version of OpenEmbedded Linux with AX.25 support. This could be used to create standalone APRS digipeaters or Winlink Telpac nodes. Combined with a WRT54G as a bridge, this would provide for a really cheap, remote packet stations.

887. Antenna Gain Measurement Party, WA5VJB’s QT H

Yahoo group: DAWG-HSMM
Date: 2006-03-11 23:19:55 UTC
From: Douglas Kilgore
Topic: 887 Message: 887

Here's an opportunity to measure the gain of your HSMM antenna. Kent Britain, WA5VJB, is holding his annual NTMS antenna measurement party at his QTH in Grand Prairie on Sunday, Apr 30.

Please contact Kent at wa5vjb@... to let him know that you will be coming. You will need to make sure that he has a compatible connector for some of the Reverse Polarity antenna connectors.

Kent has a web page at http://wa5vjb.com Spec sheets for the PC board etched antennas he manufactures is available there online.

Check the North Texas Microwave Society web page for latest details. http://ntms.org

From: Keith Berry
Topic: 888 Message: 889

Not exactly knowing the full atmospheric conditions
during your signal improvement, a couple of things
come to mind.

Humidity differences will affect the signal and sense
it is snow, it may not have produced enough blinding
to create fade.

My main thought would be you were seeing a reflected
signal from the snow and a improvement in the signal
that is normally lost from absorption of objects on
the ground.

Other ideas??

Keith

890. DC to DC Power Supply for Power-Over-Ethernet

Yahoo group: DAWG-HSMM
Date: 2006-03-23 04:59:41 UTC
From: Douglas Kilgore
Topic: 890 Message: 890

RUN, DON'T WALK to your nearest Radio Shack to pickup a DC - DC power adapter to work with power-over-Ethernet. It's on close-out sale for $30. It has 11 - 16 VDC in for 12- 27 VDC out 3.75 amps. The output is adjustable in 1 volt steps. It's called a DC Power Adapter Cat # 273-1827. It is designed to power a laptop computer.

http://www.radioshack.com/search/index.jsp?kwCatId=&kw=273-1827

When using power-over-Ethernet on CAT-5 cable, there is a significant voltage drop on long runs. For example, if a 12 volt access point draws 1 amp, over a 300 ft CAT-5 Ethernet cable there would be a voltage drop of 3.8 volts. 15.8 volts would be required at the input end to compensate.

Here's a POE Calculator:
http://www.gweep.net/%7Esfoskett/tech/poecalc.html

Follow the links on that page for instructions on how to build a POE connector.

Good hunting.

From: John Champa
Topic: 894 Message: 894

Greetings:

The old LinkSys WRT-54Gv1 @ k8ocl/hsmm definitely needs to be replaced, if only because every config change is problematic. Price isn't the issue as much as we'd like to have something which is easy to use and dependable.

Our two choices have come down to:

LinkSys WRT-54GX4
Cisco 871W

Anyone on the list have any comparitive experience with these two units?

Thanks,
John

896. 06 Wild Ride - Network Testing

Yahoo group: DAWG-HSMM
Date: 2006-04-23 01:14:09 UTC
From: J. Beadles
Topic: 896 Message: 896

Today I was unexpectedly able to hook up with Fred Varian WD5ERD, Jim (N5MIJ) & Lisa (K5LRM) McClellan to test some D-Star equipment for rest stops 2 & 3. My concern has generally been due to distance and terrain between the rest stops and the Dallas digital repeater in downtown Dallas. Initial tests seem to show that it will work. If so, this would dramatically reduce the amount of equipment we would need to make this work.

We're going back out to test everything out in its' actual operating configuration. If anybody would like to come out to particpate, you are welcome to do so. We'll be meeting at Big Daddy's BBQ, on 78 & 205, just east of Lavon at 12:30 Sunday Afternoon. This is just south of rest stop 2. Talk in will be on the 147.18 repeater, pl 107.2 A map to the area is here:

http://www.n5oom.org/2005_wild_ride/aprs/05_wild_ride_whole_route.png

Date: 2006-04-27 15:07:00 UTC
From: Douglas Kilgore
Topic: 900 Message: 900

HSMMers:
Here an opportunity to test your Wifi antenna. Antenna party at WA5VJB
Kent Britain's begins at 1:00pm Sunday, Apr 30. Let him know you are
coming and what type of connector you have.

Doug Kilgore KD5OUG

WA5VJB's QTH
<http://maps.google.com/maps?f=q&hl=en&q=+1626+Vineyard+Road+,+Grand+Prairie,+TX&ll=32.671062,-97.027645&spn=0.016076,0.042915&om=1>

Directions To 1626 Vineyard Road Grand Prairie

>From the West

Take I20 to Great SouthWest Parkway
Exit Great SouthWest but continue straigth on the I20 access road
about 1 mile to Mathew Road
Right on Mathew
1/3 rd mile to Vineyard Road Take a left.
I'm about 10 houses down on the left (North Side)

>From the East

Take I20 to Great SouthWest Parkway
As you exit, immediately take the U turn lane to the left.
Head back East on the I20 access road about 1 mile
to Mathew Road.
Right on Mathew
1/3 rd mile to Vineyard Road Take a left.
I'm about 10 houses down on the left (North Side)

I'll have 972.849.0235 with me if you get lost.

Kent

I'll take care of the soft drinks, Al will take care of the brews.

We'll have snacks and a party tray from Sam's or something.
You are quite welcome to bring along chips, snacks, etc.

Doug, don't forget your reverse pin adapters for the WiFi lads.
I've also upgraded my multiplier for 2400-2480 MHz measurements
for their antennas. The WiFi bunch is quite welcome.

I've been working on cleaning out the garage, so I'll have a variety of
stuff out that's looking for a good home. And a few items with very
reasonable price tags. You're welcome to make a fleamarket out
of this event as well.

So far the requests are for 900, 1296, 2304, 2400, and 10,000 MHz.

See ya Sunday, Kent

902. nmo wifi

Yahoo group: DAWG-HSMM
Date: 2006-05-04 05:25:41 UTC
From: Wes johnston
Topic: 902 Message: 902

Anyone got any suggestions for a NMO 2.4gig antenna? I'd like to mount a NMO on the roof of our comms trailer so that one of the wrt54g antennas is inside the trailer mounted to the inside ceiling, and the other is outside. The trailer is aluminum.

Antenna under consideration is http://www.hyperlinktech.com/web/hg2405unmo.php a nmo wire with two coils in the center. It's so cheap, and can surely handle the occasional bout with a tree limb. Is it even worth trying?

Also http://www.hyperlinktech.com/web/hg2409u.php but it is an N type mount. Anyone with experience with this one? Should I just get a NMO to N adapter cap? It's 20" tall and I'm not so sure it will do so well with low tree limbs.

Any other suggestions?

I just looked at the 2005 wild ride PPT, and geez it'd be slick to mount an A/P on a parabolic grid up kinda high on our trailer's crank up tower.

Wes

Are you running a hacked version of the software on this router? My understanding is that the diversity settings for dual antennas do not do well when the antennas cover two different areas. As I understand the diversity use of dual antennas, they both need to be hearing the same thing to allow the algorithm to compare signals and select the best antenna.

That being said, I've got the N mount unit on top of work truck on a bracket. It works well, but has been whacked by branches and such many times, bending the bracket. The NMO mount whip is a fairly good solution, I've used that on a different vehicle while netstumbling. Keep in mind that the more 'gain' you have on these antennas, the flatter the signal pattern is. I also have an 11 db whip, but I've found that driving down the highway I can see an access point, but just pulling over to the side of the road where the car leans over 10 degrees is enough to lose it again.

Also, putting it on the roof of the fan is a good general use idea. I would sure plan to get it up in the air 20 feet or so once parked however, I've seen interference from the 2.4Ghz gear back into the public safety radios, and also the pattern from the ground plane of that com van is going to extend out well in the immediate area.right over every one's heads. A bit of elevation and a low gain antenna would blanket the immediate area better.

Good luck!

Here's some ideas about the type of antennas for use on a comm van.

First, it's on a trailer so operation will be from a stationary position. Will you be receiving an internet connection from the outside? If so, a directional antenna with higher gain will allow you greater distance from the source. Also, if you are operating in a crowded Wifi environment, the directional antenna will allow you to better eliminate some interfering signals.

Line-of-sight is important with WiFi signals and that usually means getting above surrounding objects. Therefore mounting the antenna high is desirable. But mounting an WiFi antenna high and then using a long coax to bring the signal down is counter productive because of the signal loss in coax. It's also expensive.

The solution is to mount the access point on the antenna high up in a weather proof box on a mast that can be attached to the side of your comm van. Use Power-over-Ethernet to power the device using inexpensive Cat-5 wire. Inside the trailer, use an inexpensive router for a wired feed to multiple computers if needed or buy a second wifi access point for the interior of the van. They're cheap. Operate them on a separate channel and with a different IP address, ie, 192.168.2....

We've used a WRT54G with Sveasoft Alchemy in WDS mode. One antenna port was connected to a directional antenna pointing to the internet connection about 1000 ft away. The second port had an omni antenna to distribute the signal around the immediate area.

In our endeavors we started with access points in a weatherproof box separate from the antenna but eventually we evolved to using the Pacific Wireless Rootennas where the access point is mounted inside of the antenna. http://www.pacwireless.com/products/client.shtml You can punch the aluminum backpanel for an "N" connector for a second antenna if desired.

Good luck on your endeavors.

We will soon have direct PC satellite internet (or whatever they call it this week) mounted on the roof of the trailer. I'll have a wrt mounted on the inside of the roof of the comms trailer with an antenna poking thru the roof to serve laptops in the vicinity of the comms trailer. The stock wrt antenna will be hanging down from the cieling inside. If I need to go a great distance, I'll mount another wrt inside a weathproof box on top of the tower with a parabolic grid or something like that.

Thanks for hte tips though... but I was looking more for info about the durability of some antennas.

They have been selling these for over a year now. Fab-Corp has been advertising them for quite a while.

Comet/NCG have been selling commercial antennas for many years.

Good luck in pointing your antenna...I'd like to know how you make out and what satellite ISP you are using.

We use StarBand and it is hard to point.

910. 06 Wild Ride

Yahoo group: DAWG-HSMM
Date: 2006-05-04 22:43:48 UTC
From: J. Beadles
Topic: 910 Message: 910

All,

It's time to get cooking for the 2006 Wild Ride. This is a bike Rally held in Richardson, TX on May 20. The ride is supported by the Richardson Wireless Klub and other local area clubs. For the past 2 years, we've run HSMM links to the start/stop and rest stops so that we could test out hardware, experiment with practical digital operating practice and demonstrate the technology to interested users.

This year we are going to try it again again, as a demonstration traffic passing exercise for any of you who are interested in participating. We will be using 802.11 and D-Star equipment, so you'll get to see both in action. If all the kinks can be worked out in time, we expect to pass traffic using Winlink (using Paclink over Telnet), digital video and digital photos.

In addition to the event on May 20, we'll run software installation and training sessions before the event, and operators will be welcome to participate in path testing.

There will be stations at Start/Stop and at four rest stops as volunteers permit. We will only staff stations where there are enough operators, and each station needs at least two operators. If you are interested in volunteering please let me know as soon as possible so I don't waste time testing out unneeded stations.

Anyone is welcome to participate regardless of your current level of expertise or available equipment. If you do wish to volunteer, please let me know if you have any of the following equipment to use:

1. A laptop with or without Wifi connectivity
2. A digital camera and the ability to download to a computer in the field
3. Any kind of web cam that can transmit over the internet
4. A wireless data card & commercial service
5. A WRT54G that you want to configure for HSMM use

Mic at Comet simply categorized the 2.4 antennas already made for ISM as
HSMM.

Seeya,
Dave

912. 2006 Wild Ride - Digital video

Yahoo group: DAWG-HSMM
Date: 2006-05-04 23:13:23 UTC
From: J. Beadles
Topic: 912 Message: 912

For the 2006 Wild Ride HSMM event, we want to play with digital photography again. We did this last year with mixed results. I'm asking for ideas for practical ways to carry this off.

Two events I was party to are driving this. First, at this years' Collin County Skywarn School, the NWS instructor mentioned that he'd love to have live video from spotters in the field. Second, our local club has participated in local public security events, from christmas mall crime patrols to standing watch in an apartment complex watching for a serial rapist. In both cases, live video over HSMM worth developing.

There are many ways to send digital video over the internet. However, it occurs to me that it'd be useful to define a standard. If you were to provide digital video for the NWS during spotter events, what method would they need to receive it? In addition, it occurs to me that it would be useful to have the ability to embed some data in the video stream that could be picked out, such as call sign, gps coordinates, camera azimuth, and maybe telemetry. Is anybody aware of a good way to do this, that would be cheap or maybe free?

Another aspect is what hardware to use. Last year we used a number of desktop webcams with generally poor results. Consumer webcams are useable in some circumstances, but generally not outdoors where scenes require wide depth of focus or wide changes of brightness. Personally I've invested in a high resolution JVC security camera and a variable telephoto, auto-iris lens, and will be using a USB video digtizer.

Another solution is to use a digital camcorder with a Firewire (IEEE 1394) connection and WebcamDV software. This $20 software allows a digital camcorder to be treated as a standard windows video device, useable with cheap webcam software. I tried this and it provided the best, crystal clear photos I've seen yet. Unfortunately my Sony camcorder powers down automatically if left alone, even when plugged in. Also, the Firewire .A spec limits cable length to 4.5 meters.

There is some good, cheap webcam software floating around. I used ConquerCam last year, which worked perfectly for $10 (and a free $30 trial). We had extensive difficulties with a package, I think it was Active Webcam. It was very flexible, but extremely difficult to configure correctly. In any case, I'd really like a program that would allow me to embed live GPS data in the frames. Anybody have any ideas? There are some commercial packages, but cost in the hundreds of dollars.

Along with digital video, we would like to be able to move digital photos, preferably tagged with GPS information. Here are a couple of interesting links that tie in to this.

Microsoft's World Wide Media Exchange (WWMX) project would be neat to use with this. http://www.wwmx.org/

http://www.makezine.com/blog/archive/2005/07/how_to_gps_tag.html

Here's a commercial GPS tagged camera, but expensive:
http://www.geospatialexperts.com/purchase%20standard.html

Here's a freeware program, but doesn't quite do what I want.

Paul,

Last year we did WDS bridges using Sveasoft Alchemy. It worked successfully. The only comment I have is that the bridged link needed about 20dB over threshold and 20dB SNR to function. A 2 mile hop worked with no issues, but a .5 mile with other APs in the main beam did not. I was unable to crank the power or increase antenna size sufficiently to overcome this interference. In point of fact, the link did work, but was unreliable enough that DHCP did not work over it.

918. D-star testing tomorrow

Yahoo group: DAWG-HSMM
Date: 2006-05-06 00:10:47 UTC
From: J. Beadles
Topic: 918 Message: 918

All,

I'm going to do some D-star testing in the N Dallas area tomorrow. Probably after about 4pm. Anybody interested in tagging along, yell at me at 972-898-0843. Will be listening to the Plano rptr, 147.18+ 107.2 (?)

Well, nobody is interested in tagging along to test this stuff. Today's
testing didn't go very well. I have 2 ID-1s, neither worked. However,
We were able to verify the path with WD5ERD's ID-1. Either my tri-band
mobile antenna is broke, or something is misconfigured on the radios.
Heading over to N5AC's house tomorrow to put it on his bench.

Thats interesting.
The radios have to be configured correctley to get
into the repeater, I had that problem with my ID-1.
To get throught the Gateway to a remote repeater you
have to be registered in the Gateway which is not an
automatic process.

Good Luck and 73

Interested, yes, but the timing is bad (for me).

I find the ID-1 (and D-Star) to be a fascinating peek at the future.
And if they have another signficant price drop, I'm sure more of us
will be in the market... :-)

Yeah. I'm not even doing that, though, I'm just trying to ping the gateway. The config was set up for me by the repeater owner, who is out of town this weekend. I worked with WD5ERD, who was able to see me transmit, and saw the repeater respond, but I got no RX. I'm using a Comet tri-band antenna on an N magmount. Maybe it isn't working.

Sorry Dave, I shouldn't have said nobody was interested. I know that
a lot of folks are out working the MS150 this weekend. If I didn't
have to be doing this, I'd be with you.

I'm in the same boat with you. Interestingly, the price did drop
from $1300 to $999. So there is hope for another price drop later.

Wish I could have been there but was tied up all day (I will be tied up again today with the club's Tech class this afternoon at the Heard Museum). Are you saying your difficulty was accessing the voice or data repeater?

Were you trying to access the Internet? Be sure that your entire 8 character "call" has been entered on the gateway (Jim, Bill, or Gerry do this I believe) to get Internet access and (for high speed data) that you are using the IP address they assigned (not as important but it helps). For HS data:

Be sure to turn off all of the Microsoft stuff on Ethernet connection (Client for Microsoft Networks and File Sharing should be unchecked on the adapter definition, only have IP checked).

Address: 10.x.x.x (assigned when you get registered with the gateway as explained above).
Mask: 255.0.0.0
Gateway: 10.0.0.1
DNS: 10.0.0.1
Repeater 1: K5TIT A
Repeater 2: K5TIT G
MyCall 1: your _gateway registered_ callsign and extension.

Hope this helps.

Remember that your squelch goes into attenuate mode when set to half (just like most other Icoms). If the repeater and gateway was seeing you, your antenna is working. Look towards the squelch setting and also make sure that TX Inhibit isn't on (it defaults to on when in HS data mode). I doubt it was this last part if WD5ERD was able to see you.

Pete,

Jim set up everything, and the IPs I have can ping the gateway from Fred's ID-1, but not the other one I have. At this time, I'm only trying to ping the gateway, not pass through it. I could do this from Fred's radio once it was configured, but not from mine.

Fred works with Jim McClellan and Jim More. Jim configured these radios, so I'm in that chain of knowledge.

In any case, Jim was out of pocket this weekend, so I took the radio over to Steve N5AC's house. Steve is working to set up a Collin County D-Star repeater, and works with Jim, Bill & Fred.

Still, no joy. Steve shows that the radio will transmit on voice, but cannot be made to transmit data reliably. The network activity light flashes when it sees my packets, but will not transmit. We did see a couple of transmit light flashes, maybe .5% of all packets pushed to the radio. Steve flushed and reprogrammed that radio and another one new out of the box. The new radio behaves correctly, but the radio I have does not.

Well, guess I'll work on the other radio I have and wait for Jim to come back to look at this oddball. Also, Steve gave me some 1.2GHz Yagi plans, so I'm going to start working on that.

All,

So far I only have one person interested in doing HSMM at the Wild Ride. If you are interested in doing HSMM in the field, we're providing the opportunity for your benefit. However, I'm not going to attempt to staff digital stations where there are not enough persons to man them. If you are interested this topic, participate!

There is a week and a half to go to the Wild Ride. If you are interested in doing this, please let me know in the next couple of days, or I'll start to shut down unneeded activities.

932. Wild Ride Internet Connections Rest Stop #1 and #4

Yahoo group: DAWG-HSMM
Date: 2006-05-11 02:38:26 UTC
From: Douglas Kilgore
Topic: 932 Message: 932

Here's info on internet connections for Rest Stop #1 and #4 for the Wild Ride Bike Rally on May 20. Both are in a residential area so connections are relatively simple.

Rest Stop #1
It's located in the same cul-de-sac as last year. The townhome management office is located about 150 feet away over a fence. We have permission to connect to their open wireless connection in their front office which is unfortunately on the side of the building away from us. Their building is evidently well shielded so we will need to place a wireless client outside their window and run about 300 feet of CAT-5 wire to the rest stop location.

Rest Stop #4
This is a new location for this rest stop. It's in the parking lot of an elementary school. A homeowner directly accross the street has agreed to let us use his cable internet connection. He has only a single connection so we will unplug his computer from the cable modem and plug in our wireless access point. There's even a high up ledge in his front window which will support placement of the access point with a 6 db flat panel antenna connected.

Doug,

Still working on the ATT location. Received a call from the manager, but the building support folks are VERY picky about anything on the building. He is supposed to look at the roof and see what we might be able to do. The balcony will not be an option as there is not power out there.

As a side note, Countrywide is a sponsor for the Wildflower Festival. If you approach their building folks, they might be willing to let you use their roof.

I will advise ASAP on the other building.

Regards,
Keith

935. D-Star implementation

Yahoo group: DAWG-HSMM
Date: 2006-05-12 13:52:31 UTC
From: John Barrett
Topic: 935 Message: 935

After seeing all the traffic about D-Star over the last few weeks, and looking over the pricing for D-Star gear -- I'm starting up a project to build a bare-bones 1.2 ghz 128kbps D-Star compatible data radio.

I was speaking to Fred, WD5ERD, and he mentioned a project that was stalled on their implementation. I was wondering if anyone had information about that or other D-Star clone projects, or information that might help me refine my designs.

I'm looking at a IF-less DSP based solution utilizing direct RF-to-baseband conversion quadarture modulators/demodulators with an AVR32 microcontroller to manage the ethernet, usb. and radio ports. An FPGA/CPLD solution may also be viable considering that the "modem" need only handle a 1mhz sample rate, and FPGAs are readily availabe that can handle 50x that rate.

My current major issue is getting my hands on Verilog/VHDL/DSP source code for quadrature GMSK mod/demod, and getting my hands on a DSP evaluation kit for creating a prototype implementation. Any help in these directions would be most appreciated !!

John, I hope you can do it. D-Star is ok, just waaaay too expensive.

937. Video frame grabbers

Yahoo group: DAWG-HSMM
Date: 2006-05-13 20:37:45 UTC
From: J. Beadles
Topic: 937 Message: 937

Anybody know of a good USB2.0 video frame grabber that'll work on Win2k? These used to be on the market until the focus changed to video stream collection. Now nobody publishes the specs on the units anymore. I'm wasting a huge amount of time finding out which ones don't work.

The Hauppage USB Live and KWorld DVDMaker USB 2.0 both seem to capture video at a max frame size of 320x240, meaning that you have to scale up images, making them very poor. I looked at the Hauppage WinTV-USB2, but that's XP only. So far, I'm really disappointed at the offerings.

Whilst playing with the D-star unit that worked this last Sat and Sun, I hooked up my nifty JVC CCTV camera to the KWorld digitizer and went driving. The software, ConquerCam, was set to send a frame every 30 secs, and would just time out if I was out of D-star coverage, which happened a lot.

If I could get a better USB digitizer, the camera works very well, even in low light. Unfortunately at 320x240 frame size, I couldn't see enough detail to focus the lens very well. Many twilight scenes leave the ground too dark as the bright sky causes the iris to close. Here are some frames:

Daytime (at rest stop 2)
http://www.k5rwk.org/wr/comm2/140506@...

In to the sun

941. 06 Wild Ride HSMM Initial Summary

Yahoo group: DAWG-HSMM
Date: 2006-05-21 19:48:46 UTC
From: J. Beadles
Topic: 941 Message: 941

The HSMM training opportunity at the 2006 Wild Ride bicycle ride in Richardson, TX was generally successful, with the usual complications. Photos will be forthcoming.

LOCATION CONFIGURATION

Start-Stop - This used 3 hops of 802.11, with Linksys WRT54G radios running Sveasoft Alchemy as firmware. Bridging was performed using WDS. Kevin KD5YVL reported that this was rock solid the entire time, and that all tasks were successfully completed.

Rest Stop 1 - This was intended to use an 802.11 client bridge to an open AP volunteered by a local realty office. We were unable to make the client bridge work, and a Sprint EVDO card was substituted as the internet source. This was reported to work, but no other status information has been made available at this time.

Rest Stop 2 - This was a D-Star hop connecting to the Dallas K5TIT repeater. This was connected to the WAN port of a WRT54G. The D-Star ID-1 used a home-built 9 element Yagi built using plans provided by Steve N5AC. The system was known to work when I set it up. However, it was reported to have failed later in the event, possibly as a result of sending megapixel photo images in violation of the pre-event instructions. No additional information is currently available.

Rest Stop 3 - This was a D-Star hop connecting to the Dallas K5TIT repeater. This was connected to the WAN port of a WRT54G, which acted as an AP to the rest stop located over 1000 ft away. The difficulty arose when I realized that I had used all of my high-gain 802.11 antennas and had only an 8db panel left. This allowed the rest stop operator to access the point with a USB wireless adapter, but just barely. I had one additional WRT54G and found a 2.4GHz yagi and set those up as a separate bridge to the actual rest stop. This was successful, and worked for the duration of the event.

Rest Stop 4 - This location used a direct 802.11b connection between the rest stop operators laptop and an access point provided to a local volunteers' home internet network. No additional information is currently available.

Rest Stop 2 -- I realized that the file sizes were too targe early in the first image, shrank the images and the 1st batch of uploads worked fine after a couple of false starts... 2nd batch failed completly a couple of hours later (entire link seemed to be down)

Or did my killing the transfer not actually kill it and the upload continued ?

Hey John, after re-reading my msg, I realize that I sounded a lot more critical than I meant to be (especially given my own errors). I've had a chance to review the photos, and it looks like you and RS4 were the only ones to to follow instructions!

I have no idea what would cause the link to fail. Did you try power cycling the whole thing?

944. 06 Wild Ride - HSMM Tasks

Yahoo group: DAWG-HSMM
Date: 2006-05-22 03:00:01 UTC
From: J. Beadles
Topic: 944 Message: 944

For the HSMM event, I gave each of the digital operators a set of tasks. These tasks were intended to simulate things that might have to be done in an operational environment. The goal was to get local hams thinking about how to use these tools and what to expect from their use.

EMAIL USING WINLINK - The Collin County ARES org has adopted Winlink for non-tactical messaging, especially for potential use in mass medical or inocculation events. Winlink allows for streamlined internet compatible email, over HF, VHF and Telnet links. Our county Emergency Coordinator, Bruce Dingman, N5BYL, put in a large amount of time helping to get the digital operators up on Winlink over Telnet.

Keven Simms KD5YVL, the digital operator for the Start/Stop, was able to establish email links with each rest stop. I was the only exception, as I had not gotten my winlink install finished up and had to rely on yahoo mail over the 802.11b links.

DIGITAL WEBCAMS & STILL PHOTOS - The digital operators were tasked to provide still photos or webcams where ever feasible. I put together an FTP site to receive the photos, and a scheduled process to publish them on the web every couple of minutes. In practice two things failed in the photo process. First, the scheduled process stopped at midnight the night before the event, and I didn't catch it. The photos did not process until I manually ran the script. Second, I forgot to adjust my script to account for .jpg filenames being upper or lower case. Thus, not all photos got processed until I fixed it.

A number of digital photos were FTPd by Start/Stop, RS1, RS2 and RS4. The network was not completed at RS3 until it was time to pull the network down. I ran the only webcam from my truck, connected to the access point at RS3. As mentioned in previous msgs, the digitizer is too poor to provide much detail. I loaded my still photos to the server after the event. The photos, under Asst. Comm. Mgr, show the D-Star systems at RS2 and RS3.

http://www.k5rwk.org/wr/

All in all, the best result we've had in the past couple of years. Thanks to all the operators who participated.

From: John Barrett
Topic: 941 Message: 945

No -- didnt try the power cycle -- it was the tail end and only had a few
pix to upload -- the bulk had already been sent up

Wasnt worried about the critical -- just wanted you to have the facts about
what happened :)

Besides -- trying to upload 1.8meg images on a 128k link woulda taken longer
than we were gonna be there :) :)

946. Wild Ride Rest Stop #4 Digital Access Point

Yahoo group: DAWG-HSMM
Date: 2006-05-23 19:55:24 UTC
From: Douglas Kilgore
Topic: 946 Message: 946

Wild Ride Rest Stop #4 was set up in a school parking lot in a residential area. A homeowner directly accross the street from the school agreed to let us use his high speed internet connection. This was supposed to be a easy setup because he had only one computer connected to his cable modem. It was just a matter of connecting the access point in place of the computer.

The access point used was a Linksys BEFW11S4 with a Linksys WSB24 signal booster attached. Two Airlink ASB-8DA 8dbi directional antennas with 18 inches of coax were used because that access point sends on one antenna and receives on a second,

On Thursday before the rally, the access point equipment was first positioned on a ledge high in the front window of the house looking out over bushes to the school parking lot. The wireless connection standing in the house was 100% at 11Mbps. When tested accross the street, there was not a usable signal. The equipment was then placed on the bottom window sill and the antennas were positioned outside of the window looking at the school through the bushes. The signal everywhere in the parking lot was then very high.

The problem was the metalized sunblock material on the window glass. With the antennas placed outside, the problem was resolved.

For security reasons, the antennas could not remained installed through an open window. So homeowner woke up early Saturday, opened the window slightly, and placed the antennas outside. He plugged in the access point and everything was a go. He and his wife received volunteer T-shirts.

He was a retired aerospace software engineer so he was very interested in what we were doing. He and his wife came over and visited the rest stop area during the rally.

947. NMO mount wifi antenna

Yahoo group: DAWG-HSMM
Date: 2006-06-06 01:31:23 UTC
From: Wes johnston
Topic: 947 Message: 947

A few months ago, I asked this group about a NMO 5.7dB antenna from hyperlink. Went to order this $19 antenna from them, and now see that they have a $100 min order. Does anyone have any idea where I can get a comparable antenna? I'm just trying to get a decent antenna on the roof of our comms trailer.

Here's the hyperlink antenna http://www.hyperlinktech.com/web/hg2405unmo.php

I hope to have something by field day.

Wes

Over the July 4th weekend, the local Frys' Electronics had the following products of interest:

$19 Airlink 10dB indoor omni antenna - white plastic antenna with short pigtail and an RP-SMA connector.

$29 TrendNet 2.4GHz lightning protection kit - A kit with a lightning arrestor, a length of ground wire and a small N to SMA pigtail. I didn't get a good enough look to see if the lighting arrestor was N or RP-N.

I have several friends with WildBlue and it is a very good service. Pricing is reasonable compared to other similar earth station services and there is even capability of billing onto your existing phone bill if you are an AT&T subscriber. See www.attwb.net/

I'd like to see coverage of this in the 'Main Street' computer magazines, and in the CES daily publications. (CES now incorporates what we used to call the 'COMDEX'). I'd also like to see publications showing beginners how to get started with amateur radio applications with HSMM - - the things that can be done only with a ham license. ARRL offers one book - that needs a few additional chapters. I see opportunities to encourage new people to get licenses and become involved with the many things we do.

964. can I go 900' wireless with standard equipment (non-amateur)

Yahoo group: DAWG-HSMM
Date: 2006-08-14 16:46:47 UTC
From: Dave NØRQ
Topic: 964 Message: 964

This question isn't truly ham-related, but merely wireless router-related.
(But it is on behalf of a non-profit private school, so I hope you don't mind.)

Is it possible to have a wireless network, using somewhat standard
(not too expensive) equipment span a distance between 2 buildings
of 800-900 feet? One building has metal siding, but we could put up
an outside antenna on it.

It wouldn't have to be blazingly fast, just a decent connection, without
an outlay of oodles of cash. (Modest outlays are OK.)

One end would be a DSL supply, the other end is a typical PC ~900'
away.

Thanks.

If you use the DD-WRT (third-party firmware) on the Linksys router you can boost the output power of the router and that would help. By default the Linksys xmit power is 28mw. With the firmware upgrade you can adjust the xmit power as high as 250mw.

Thanks for the input, David.

Can these WIFI Omnis be plugged into a typical wireless router (on the DSL end)?
I'm thinking that maybe you open the router box, unsolder the built-in antenna,
and solder in a new piece of coax.... is that right?

How do they connect at the PC end?

And is there a good place to purchase such items, and a ballpark price?

Like I said, I don't know much about this subject. My routers are all hard-wired;
my entire house is wired with Cat5e.

My router at the shop is a Belkin, it as external attena connections <SMA>
The omni ant's have N-type. I got the cable with the right end and all from
a guy on ebay. The antenna was like $50, the routers on ebay run around 75..
I think I have maybe $200 in the whole systems.

969. 2006 Plano Balloon Festival

Yahoo group: DAWG-HSMM
Date: 2006-08-15 03:01:36 UTC
From: J. Beadles
Topic: 969 Message: 969

We'll be providing ham support at the Plano Balloon Festival again this year. The festival will be held on September 22,23 and 24 with balloon flights in the morning and evening each day. Approximately 65 hot air balloons will be involved in the event. We provide communications support by tracking the balloons and crews from liftoff to recovery.

Once again I'm trying to include an video over HSMM component, but I'm about ready to give up for the mean time. I'm trying to put a high quality surveillance camera at one end of the field so that the field Net Control can see what is going on. For the past couple of years we've been trying to do some form of inexpensive video over ethernet solution but nothing has come to pass. Even USB video digitizers have fallen short. Does anyone know of an internet video server that works that runs less than $200? I've put out a few hundred $$$ for experimentation, and that budget is just about dry. My preference is NOT to put a desktop or laptop at the remote camera site, as that pumps up the $$ and power requirements.

Topic: 964 Message: 970

Go buy two linksys WRT54GL routers for about $60 each. Then head to ebay or fab-corp and buy two high gain (probably in the 15db+ range) patch antennas and the cable with the appropriate connection ends. I recommend panel antennas because you will get a stronger>faster signal from those and you didn't really specify that you needed to wifi the general area. You could do something use one onmi and a patch for the remote if you wanted. The clearest line of sight (no metal buildings) will give you the best performance. If you do want to wifi the area, use omnis, WDS and WPA, understanding that high gain omnis have a pretty narrow beam vertical width.
Download the latest firmware from www.dd-wrt.com and get the v23 SP1 or v24 if you want to get the latest alpha version. You want to get the generic image. Get the voip image and you can have your own internal (secure) phone network with something like a sipura ATA. You can either set it up as WDS or as a client. Also do a frequency sweep and determine the least use channel. The appropriate channels are 1 6 and 12, or if it is crowded you can get buy with 1 4 8 12 or something close to that. A wifi channel is much larger than the numbered channels. You can up the power using dd-wrt but there are some rules and diminishing returns, so somehing in the 50-800mw should keep you inside of both concerns.

For cheap router check out the $5 fon router offering.

To: <ham-80211@...>

A few locals have been laying with a derivative of Asterisk called Trixbox... which is basically an open source PBX . (And Trixbox is a web front end for Asterisk) I have a Zyxel wifi phone and have been looking into possible two-way radio integration: http://www.allstarlink.org/ And if nothing else, since that route seems expensive, a simple FXS interface to an under used autopatch could be interesting.

Asterisk is some very powerful stuff, perfect anyone who is familiar with Linux and likes to tinker. What's neat is when you add a WiFi phone to the mix, it's has the potential as 2.4 GHz digital voice ham radio.

From: Douglas Kilgore
Topic: 975 Message: 975

Winlink2000: Digital Messaging for EMCOMM is the topic at the 9/11/2006 monthly meeting of the Richardson Wireless Klub.

Winlink2000 is a system of programs for hams that allows digital messaging over HF, VHF-UHF and microwave frequencies. Using some of the components of the system, familiar email programs such as Outlook Express and Netscape Messenger can be used to send and receive messages. A live demo will show how it works.

Please mark your calendar and plan to attend.

Date: Sept. 11, 2006
Time: 7:00pm
Location:
St. Barnabas Presbyterian Church
1220 West Beltline (east of Richardon high school)

Wow .. Shakespeare's new military antenna catalog includes
A broadband wifi antenna rated at 25 watts, and 2.5:1 or better VSWR
500 MHz thru 2500 MHz ..

http://www.shakespeare-military.com/catalog/sectionwifi.pdf

And you thought that BPL "pollution" of the amateur radio spectrum was all there was to worry about...

Gas-line broadband a pipe dream?

So intense is the drive to deliver high-speed Internet service to American homes that entrepreneurs have seemingly tapped every conceivable pathway: fiber-optic cable, the air, even power lines.

Now the relentless pursuit for faster, cheaper broadband is leading to perhaps the last unclaimed conduit to your house: natural gas pipes.

Nethercomm, a San Diego-area start-up, says it has developed technology to send lightning-fast broadband and TV services via wireless signals through the pipes that deliver the fuel used to heat homes and fire up stoves.

Gas pipes serve 62% of U.S. households, says the American Gas Association. Broadband in Gas, or BIG, could give consumers a third high-speed option at low costs and speeds that far surpass today's phone and cable offerings. It also could bring fast Internet to unserved rural areas. But, so far, the idea has been met with both excitement and skepticism.

"It's been a Coke and Pepsi (battle) between cable and phone companies," says Nethercomm founder and CEO Patrick Nunally, 42, a veteran high-tech entrepreneur. "We're in a position to come in and provide real competition."

More important, Nunally says, the pipes could be used by pay-TV providers to compete with cable and satellite. In fact, he says, Nethercomm and local gas companies would lease the wireless spectrum to any provider for myriad services: cable giants seeking extra bandwidth for their high-definition TV channels, phone companies looking to pare their multibillion-dollar investments in fiber-optic cable, even businesses such as medical providers with high-bandwidth needs.

Gas companies, besides earning revenue from leasing their pipes, could use the broadband service to remotely monitor the integrity of their lines and read gas meters.

"I think there is a general pulse of excitement" about the technology among publicly owned gas companies, says Bob Beauregard of the American Public Gas Association, which represents 650 gas providers serving 5 million rural customers.

Nunally says he hatched the idea in 2002 while searching for a new TV and broadband artery to the home that didn't require digging up streets. Around the same time, some California utilities were stringing fiber cable through gas lines to offer broadband. But the process was expensive.

Nunally says he had a "light bulb on the head" moment: wireless. Normally, the twists and turns of a gas pipe would cause wireless signals to lose strength. But ultrawideband, a new unlicensed wireless technology, sends out pulses of radio energy across such a wide swath of frequencies that if some data packets are lost, others can easily make it to the home.

Also, federal rules that limit the strength of ultrawideband signals don't apply in underground pipes. So, Nunally says, power levels can be boosted to provide each household bandwidth of up to 6 gigabits per second, several times that of a cable provider. Yet power is low enough so that signals can share the pipes with natural gas without starting a fire, he says.

A similar initiative, broadband over electric lines, is further along, with services offered in Manassas, Va., and Cincinnati and a rollout planned for Dallas this year. But the electric companies don't offer TV services and incur high costs to bend signals around transformers.

Broadband in Gas would require installation of an ultrawideband transmitter that's linked to an Internet backbone or pay-TV facility at a gas company's network hub. A receiver would be placed at a customer's gas meter. Build-out costs are about $200 per household, Nethercomm says. By contrast, broadband over power lines costs about $600 per household, while phone and cable TV networks each cost well over $1,000 per home to build, says West Technology Research Solutions.

Broadband in Gas "really has the potential to accelerate adoption of these technologies," says George West of West Technology.

Yet some say BIG is, well, a pipe dream. "It's really easy to make these kinds of claims, but it's much harder to prove in practice," says JupiterResearch analyst Joe Laszlo.

Nunally says the company, which has tested the service, plans field trials next year in San Diego, Chicago and Atlanta. But officials of Nicor Gas in Chicago and Atlanta Gas Light say they have no such plans.

"We're intrigued by the technology, but we never got that far in our discussions," says Nicor spokeswoman Margi Schiemann.

Nunally says BIG could sharply cut costs for companies such as Verizon Communications, which is spending $20 billion on fiber rollouts. Verizon and Internet provider EarthLink say they have no immediate plans to

deploy it.

And Freescale Semiconductor, the ultrawideband company that was working with Nethercomm, recently shifted course to focus on its handset business. "It would be hard for anybody to say (BIG) doesn't have tremendous potential," says Freescale's Jon Adams.

From: J. Beadles
Topic: 982 Message: 982

We may have had postings on this before, but if we have, I can't find them. A few companies are releasing fanless micro form factor PCs in the $100 range.

EWay Technology Systems Corp in Taiwan has a number of units, the cheapest being a 200MHz cpu with 128Mb of ram for $99. They also have an 800MHz unit with 256Mb of Ram for $189. http://www.ewayco.com/

Norhtec has the MicroClient Jr., an x86 compatible pc with various options. Can bolt on to the VESA hole pattern on the back of many LCD monitors and can boot from compact flash card. Base cost is $120, and has several options.
http://www.norhtec.com/products/mcjr/index.html

Any of these might be useful for dedicated HSMM servers, or maybe field portable emcomm web servers.

983. HSMM on 802.11a hardware

Yahoo group: DAWG-HSMM
Date: 2006-11-14 06:31:36 UTC
From: kf4yfd
Topic: 983 Message: 983

Has anyone setup a HSMM link on 802.11a? I am currently looking into deploying such a setup in Anchorage, Alaska. I would like to know what power output and antenna gain others are using and what range others are getting.

My power output will be 700mw into a 12 dbi omni at the access point and the same power output with a 27dbi dish at the "client" site. According to the link calculator at http://www.ecommwireless.com/cgi-local/wireless.main.cgi this setup would give me a maximum range of 41 miles. At 15 miles the link becomes decent with a 1% estimated outage rate (acceptable for HAM usage).

This is one of those things that makes you sick.

My mobile rig was stolen ... as in the entire vehicle along with three (3) ham rigs!

Besides the vehicle, which I don't think I will see again, are these rigs:

FT-100D - S/N 1L280214

TM-D700A - S/N 30400003

TM-331 - S/N not known at this time

Thanks for keeping your eyes open!

wayback links also work).

989. 07 Wild Ride HSMM Activity

Yahoo group: DAWG-HSMM
Date: 2007-01-15 23:04:27 UTC
From: J. Beadles
Topic: 989 Message: 989

All,

For the past 3 years, KD5OUG and have organized HSMM communications support for the Richardson Wild Ride bike ride which is held in May. It has been a gruelling event to organize, since we've had to put a lot together from scratch and do a lot of advance planning. It has been worth it, because we have gotten experience in deploying the equipment and identifying equipment characteristics. However, personally, I think I've learned everything I've wanted to learn.

Participation lately from the HSMM community has been low, and Doug has had to recruit operators from the general population to work the HSMM part of the event. This leads me to think that there aren't enough operators interested in HSMM to continue to do this at the Wild Ride.

It is my intent to cease doing much HSMM work at the Wild Ride unless there is sufficient popular interest to keep going. If anyone wants to do it for practice, I will be happy to help train and participate. If anyone is interested, please let me know and tell me what you would like to achive.

990. 2006 Wild Ride Article In CQ-VHF Magazine

Yahoo group: DAWG-HSMM
Date: 2007-02-06 16:31:37 UTC
From: Douglas Kilgore
Topic: 990 Message: 990

The Winter 2007 issue of CQ-VHF magazine carries an article on coverage of the Richardson Regional Cancer Center's 2006 Wild Ride bike rally. The three page article is complete with color photos. It's great publicity for ham's digital coverage of the event. It shows that we are doing something with HSMM in the Dallas area.

Digital modes used include 802.11b, D-Star and Sprint EVDO. Participating hams represented several clubs in the Dallas area. Hopefully the article will encourage other clubs to experiment with higher speed digital communications.

The article was previously published in the Aug. 2006 issue of the Richardson Wireless Klub's Chawed Rag newsletter.

993. New PR and 3.4GHz transverters

Yahoo group: DAWG-HSMM
Date: 2007-02-12 00:21:15 UTC
From: John Phelps
Topic: 993 Message: 993

I have again been putting some HSMM information on the internet and have uploaded 2 self created files to wikimedia commons. These are small "band charts" that show the hsmm, part15, and AMSAT frequencies relative to one another. They can be found at :
http://commons.wikimedia.org/wiki/Image:Hsmmnet-freq-sharing-5.8.gif and http://commons.wikimedia.org/wiki/Image:Hsmmnet-freq-sharing-2.4.gif. I'm shure these will come in handy for presentations. If they are inaccurate in any way (besides not being to scale, I already know) please let me know.
I have also been looking into the 2.4-to-3.4GHz transverters that are available online and was wondering if anyone has used these and what the lowest price around is. I have found one from HyperWireless for $455, but that is the lowest so far and still a bit too expensive for my taste.

An off note... does anyone know when the FCC will start handing out vanity callsigns again? It seems I have been waiting forever... thanks

Happy Hamming,
John KF4YFD

I have also been looking into the 2.4-to-3.4GHz transverters that are available online and was wondering if anyone has used these and what the lowest price around is. I have found one from HyperWireless for $455, but that is the lowest so far and still a bit too expensive for my taste.

An off note... does anyone know when the FCC will start handing out vanity callsigns again? It seems I have been waiting forever... thanks

Happy Hamming,
John KF4YFD

I found the problem with the 2.4GHz link... at the end of the link I accidentally put a period, as if it were a sentence. Computers are so picky.

Here it is again, without the period.

For your info.

Doug KD5OUG

-------- Original Message --------
Subject: [tapr-announce] TAPR Open Hardware License -- Public Comment Period
Date: Tue, 13 Feb 2007 15:19:59 -0500
From: John Ackermann N8UR <jra@...>
To: tapr-announce@...

Hi all --

For the last several months, I've been working, as a TAPR project, to develop an open-source-like license for hardware projects. We've recently posted a 0.9 version for public comment, and welcome your input.

The license is aimed at "real" hardware (the stuff you solder on) rather than firmware, VHDL, or other software-like elements. There are significant differences in the legal approach you need to take with hardware, and this agreement is aimed at those differences. As far as we know, this is the first attempt to create an open source framework around hardware.

You can download the TAPR Open Hardware License from http://www.tapr.org/OHL.

While I'm happy for comments however I receive them, there is a discussion forum at http://technocrat.net/OHL and I'd prefer to get input there so the discussion can be open. The public comment period ends on March 7.

(In addition to the OHL, we've created a companion license, the TAPR Noncommercial Hardware License, that is identical except that it limits products to non-commercial use. While that's not completely consistent with Open Source models, the fact that it costs real money to offer boards, kits, or complete products led us to think this would be valuable in some situations.)

I really look forward to comments from all quarters.

Thanks,

John

997. Need info for presentation

Yahoo group: DAWG-HSMM
Date: 2007-02-15 23:02:07 UTC
From: John Phelps
Topic: 997 Message: 997

I am readying a HSMM presentation for my local radio club and am having trouble finding the FCC ruling that states the legality of using Part15 gear on Part97 bands. Looking for a document or ruling.

If anyone else has found this I would greatly appreciate it.
In my looking however, I did find where the FCC officially stated that OFDM ie 802.11A/G is not spread spectrum but UWB and therefore (in my interpretation of Part97) would not need auto power control or have a 100watt power limit. It is FCC 01-158 .

Thanks to all,

John,

Here's another one for you:

Sec. 97.309, paragraph 4 -
An amateur station transmitting a RTTY or data emission using a digital code specified in this paragraph may use any technique whose technical characteristics have been documented publicly, such as CLOVER, G-TOR, or PacTOR, for the purpose of facilitating communications.

http://a257.g.akamaitech.net/7/257/2422/12feb20041500/edocket.access.gpo.gov/cfr_2004/octqtr/47cfr97.309.htm

The 802.11x specs are published IEEE specs, and so fall under this section.

If you go running through part 15, you'll run across Sec. 15.305, which states:

PCS devices operating under this subpart shall be certified by the Commission under the procedures in subpart J of part 2 of this chapter before marketing. The application for certification must contain sufficient information to demonstrate compliance with the requirements of this subpart.

Part 97 has no such section, except for power amplifiers (97.315 and 97.317), and that is much more limited in scope.

Can anybody tell me what would cause my Cup Holder (CD Drive) to constantly pop open? This just started yesterday. I rebooted, nothing is running other than Windows XP Pro. I reach down and nudge it closed. About a minute later the LED flickers and it pops open again. And on it goes. Could it be a software issue or mechanical issue?

Most likely, this is mechanical. You might check the door open button to make sure it is not stuck due to a grimy finger or two causing gunk to build up in the gap around it and the door.

Topic: 999 Message: 1001

Thanks Gregg,

I already blew it out with that compressed air in a can stuff. My work around is I just placed a SRV CD into it and it seems to like Stevie. (Stevie Ray Vaughn & Double Trouble) As long as it has a CD to hang on to it stays shut. Must be some sort of in-security issue and next call is to Dr. Phil.

Interesting that when I'm in "My Computer" and I right click on the drive, if the tray is closed there is a choice that says "Eject" and when the tray is open that choice usually says "Close". Regardless if it's open or closed it always says "Eject". CD-Rom (read only) drives are cheap nowadays so maybe it's gonna be a trip to Fry's later today.

Your "He knows enough to be considered dangerous" computer tech,

1004. question for the group

Yahoo group: DAWG-HSMM
Date: 2007-02-25 13:21:46 UTC
From: Wes Johnston, AI4PX
Topic: 1004 Message: 1004

I know there are a lot of people here that are in other ham and aprs groups, so many of you may know I'm in the SC State Guard. I've written a database for them that tracks resources such as people, equipment and evacuees. This database runs under PERL/Apache on the laptop in our comms trailer(s). Typically, we'll have one "server" laptop and 3 or 4 "client" laptops. I need to synchronize the data created in the field with the server located in our armory. Since this database will likely be used after a major catastrophy, there may be no internet available to us. We have funding on the way for a satellite dish for the roof of the comms trailer, but that's not here yet. And that'll only solve the problem for one comms trailer.

One of the guys in the SCSG is a private pilot and he and I were discussing using his plane as a digipeater. Then it dawned on me that we could use his plane as a packet regenerating repeater at 9600. That way the data link would appear to be one hop via his plane and there'd be no configuration in the ground stations... they'd just connect at 9600 to the armory. And if another aircraft needed to relief the first, the two pilots would coordinate turning off one regen repeater in one plane and on in the other. Folks on the ground wouldn't know it had happened.... and this solves the hidden transmitter problem. a 440 repeater is small enough to fit in the cabin of any aircraft. Seems like a win win.... but it's only 9600 baud.

Now if we could go faster (like 802.11b) it'd simplify things. Last summer during the annual inspection of the aircraft, we had a 6ghz rated NMO in the belly of the plane. Now the problem with using 802.11 is that there are simply too many of them for the plane to hear... noise floor is too high. So we need something quieter or less common. I did see an article at one time about substituting the pll xtal in a wrt54g to bring it fully into the 2.4hamband.... but there may be a better option.

So now... my question is: does any one know any 900mhz or 2.4gig equipment that will talk 110miles line of sight (the plane can be at 10,000feet "orbiting" the armory in the center of SC. Using a 15db yagi on the end of the link in the field is OK.... 15degree beam width would allow users to point the antenna in "that general direction", but the antenna on the plane has to be an omni with relatively low gain so that the plane can bank in turns and the field stations do not fall out of the horizontal lobe.
So far I've assumed that the plane would be circling over Columbia SC to cover the whole state. A more likely scenareo is that the coast of SC has no internet access, so the plane will circle midway between columbia and the coast giving us a distance of 60 to 70 miles per hop.

Any suggestions or thoughts?
Wes

From: Kilgore
Topic: 1004 Message: 1005

I'm interested in finding out more about your database system. The type of transactions being sent and whether each client laptop has the complete database or just the local details. But that doesn't answer the question you asked.

Our group in Dallas has supported the Wild Ride Bike Rally for the last three years. We have tried to use HSMM to connect reststops to the internet in order to send pictures and information digitally back to Net Control at the Start/Finish line.

Over the years we have experienced successes and failures. We can identify with your concern of the RF noise floor. One major problem we had in our first years was the RF noise floor. We tried to make a link from a city building to a bridging access point on top of the 16 story Nortel building about 1/4 mile away. Although we used directional antennas on both ends, we couldn't make the link because (we think) Nortel used WiFi on many floors creating a very noisy RF environment when looking at it with a high gain antenna. We resorted to placing a bridging AP in the middle of a field to get the signal to the Start/Finish area. (An article in the Winter 2007 Edition of CQ-VHF magazine shows what we did last year.)

In 2006 we used D-Star to connect two farthest reststops to a D-Star repeater in downtown Dallas. The longest link was made 30 miles line-of-sight with omni antennas on both ends. While the 128k bps speed was slow compared to 802.11b, it got the job done. Is it feasible to fly a D-Star repeater?

I have limited knowledge of the D-Star system so I will defer to others to answer.

To: illinoisdigitalham@yahoogroups.com

I've had my ID-1's for about a year. I use it off-and-on, between projects.

It works fine, but I noticed that when I hook up an 802.11b access point at the "far" end of the IP link, that there was a lag in getting email traffic to flow compared to a direct connect without the 802.11b access point.

When it was wired directly, I could casually browse web pages, while the email client on the laptop managed to pull an email with a large video file attachment "silently". I didn't realize it had done so because I did not see a drop in performance on the web browser side.

Prior to that, I used the ID-1s and high gain antennas (they're small at 1.2 Ghz. 1/8 the size of 2m) to bounce the sigs to the destination. I bounced the sigs off of two buildings (a 30 story residential condo, then an office building on top of a hill) to get S1 analog signals to go a total length of about 5 files.

It can also do S5 analog signals reflecting off a mountain and travelling a total of 120 miles. (That's not a typo. That's one hundred, twenty miles.). When one end is a high gain mobile (vertical) antenna, got it to travel about the same length and barely got in on digital voice. Time did not allow us to try out the digital data option over the same path.

I've since given away the access point (only costed me a few dollars) and have put the ID-1s on the side while I complete an APRS satellite project, plus a few other things.

When time permits, I'll build a JNOS system (or Linux SMTP server) and connect the ID-1s and a 802.11g access point as proof of concept for an emergency comm email system and education at the ham club meeting. Not too many local hams interested in multi-simultaneous technologies such as IP and computing, or APRS and satellites, or APRS, satellites and photography.

Bouncing 1.2 Ghz signals off of "hard" RF objects is still my favorite enjoyment of 1.2 Ghz. I'm surrounded by buildings except for about 40 degrees of visibility that there's no condos in my way.

Reply-To: TAPR Mailing List for Ham Radio Use of 802.11
<ham-80211@...>
To: ham-80211 <ham-80211@...>

Alright, perhaps I should have posted more about it.

http://www.ubnt.com/sr9_faq.php4
http://www.wlanparts.com/product/SR9

It's about the same price as the Aerocomm ConnexLink, but a lot faster. At almost a watt, comparable power. While the Aerocomm units are FHSS, these are not, they are 802.11 like clones, so you can have them in 802.11b = DSSS or 802.11g = OFDM.

I found a new notes:
There are a few requirements one must follow with SR9 cards, that have been pointed out by Ubiquiti:
*) The card does not perform well if rate exceeds 18Mbps
*) 802.11b mode is recommended, as 802.11g is very prone to interference with the SR9
*) You must use long preamble at all times
This persons testing has shown that the optimal TX power setting is 15.

I stumbled into only one other report so far. Where they "punched 5 miles through some trees and houses. Using attic mounted antennas (13db) and the Ubiquiti SR9 cards they could get a signal to noise between 10 and 20 and move a couple of megs of data at the home."

Since 2.4 is so trashed, this is interesting. And I'd like to hear more reports where people use them in similar "less than ideal" situations. I noticed they sell a 900MHz Cavity Filter, so that makes you wonder if thats going to be needed or for just really bad areas...

You could add a 3 watt Hyperlink bidierectional amp to it, for plug and play people. It really boils down to how well it does with other near by signals. But even with that pricey amp, you beat the price comparison to a D-Star ID-1 setup.

Those are my thoughts. I'd like to hear more about it.

1011. Moving To Richardson Area

Yahoo group: DAWG-HSMM
Date: 2007-03-08 14:40:20 UTC
From: John Champa
Topic: 1011 Message: 1011

Greetings!

I am moving to the Richardson area to take on a new assignment.

What is a good repeater(s) to check out to meet-up with NTMS / HSMM folks?

Perhaps I should actually join the NTMS.... more than just the reflector.

73,
John
K8OCL

A good way to meet the folks in this area and find out about repeaters is to join in by helping with some of the public service events in the area. The Wildflower Ride incorporates HSMM as part of the amateur effort. There are also many good clubs in the area. Check out www.qsl.net/n5tim for public service events.

73 and welcome to the area,
John - N5TIM

Wonderful!! Where will you be working?

There are many clubs in the area. Our HSMM folks are scattered out among several clubs. The NTMS club meetings are directed more toward microwave and weaksignal work. The HSMM folks are more active for specific events. The Wild Ride Bike Rally is one of them.

When you get to Dallas, let me know and we'll get some of the guys together for lunch.

If you are in Dallas this weekend, the Irving ARC is having a hamfest on Sat. Mar 10. http://www.irvingarc.org/

Yes, wonderful. wonderful, thank you. I am very excited, equally for the new work assignment and to meet some of the fine and fun HSMM operators in your area. I would love to meet as many of the guys for lunch as we can round up. I have questions for all of them! (HI)

In fact, I have an CQ VHF HSMM Column deadline March 23, so I will be looking for material, and taking pics and names too! We can record the gathering for posterity! (HI)

I will be working at Rockwell Collins and I should arrive in the area this Saturday looking for a bachelor pad to crash until my XYL can join me when school is out in June.

Rule One: Support your local Amateur Radio Club!
What one do your suggest for an HSMMer? Does Rockwell Collins have a Ham Radio Club?

Do you have a 2M repeater pair that you might suggest I monitor as I approach the area on Saturday? I will be coming down I30.

Thanks, and looking forward very much to meeting up with you and the other guys.

John,

Good idea! I will certainly do that. The Wildflower Ride
sounds like fun! I'm not taking much in the way of HSMM
gear with me at this time, but that is easy to change (HI).

Thanks for the URL. I will check it out.

From: J. Beadles
Topic: 1011 Message: 1017

Wow! That's a hoot. You'll be working a few blocks from Doug and I. As you come in I-30, you'll be coming in through, in order:

Rockwall
Garland
Dallas
Richardson

John listed those freqs below. I'm president of the Plano club, which is on the north border of Richardson. Incidentally, our club meeting is on Monday the 19th at 7:30, so let me invite you to that. We own the 147.18+ pl107.2 Incidentally, I'm also Pres of the Nortel ARC for now, though accessing those meetings is more problematic.

I just posted a presentation on our web site of stores where you can get project materials in the N. Dallas area - it is in the "Quick QSTs" section of the home page, which is:
http://www.k5prk.org/index.php
(and if anybody else has any suggestions, please let me know and I'll update it.)

Other clubs you might be interested in: Our group is something of a subsidiary of the North Texas Microwave Society. The NTMS is a more technical microwave group, with a lot of construction, contesting and EME activity.
http://www.ntms.org/

D-Star activity is promoted by the Texas Interconnect Team, which is local. They are a mainstream group, with fairly substantial hooks into Icom's product development group. We expect to see a lot of D-Star repeaters going in the local area.
http://www.k5tit.org

In fact, we're moving the PARK repeater, and are installing a high speed D-Star system (and Winlink PMBO) to support Collin County ARES.

The regional Hamfest is Hamcom, which will be held in Plano on June 8 & 9. Seeing as how you are going to be here, and seeing as how I'm still programming director, and seeing as how I'm still looking for programs, expect me to hit you up. Incidentally, they are holding a National D-Star Users Group meeting here at Hamcom this year.

John,

That IS a hoot! Fantastic. It's a small and wonderful world.

Wow! And what a great buch of activity. Choices, choices! (HI)

Looking forward to talking with you this weekend!

Thanks for all the help!

Vy 73,
John
K8OCL

Subject: [ntms-hsmm] Re: Moving To Richardson Area
Date: Fri, 09 Mar 2007 01:46:54 -0000

Wow! That's a hoot. You'll be working a few blocks from Doug and
I. As you come in I-30, you'll be coming in through, in order:

Rockwall
Garland
Dallas
Richardson

John listed those freqs below. I'm president of the Plano club,
which is on the north border of Richardson. Incidentally, our club
meeting is on Monday the 19th at 7:30, so let me invite you to that.
We own the 147.18+ pl107.2 Incidentally, I'm also Pres of the Nortel
ARC for now, though accessing those meetings is more problematic.

I just posted a presentation on our web site of stores where you can
get project materials in the N. Dallas area - it is in the "Quick
QSTs" section of the home page, which is:
http://www.k5prk.org/index.php
(and if anybody else has any suggestions, please let me know and I'll
update it.)

Other clubs you might be interested in: Our group is something of a
subsidiary of the North Texas Microwave Society. The NTMS is a more
technical microwave group, with a lot of construction, contesting and
EME activity.
http://www.ntms.org/

D-Star activity is promoted by the Texas Interconnect Team, which is local. They are a mainstream group, with fairly substantial hooks into Icom's product development group. We expect to see a lot of D-Star repeaters going in the local area.
http://www.k5tit.org

In fact, we're moving the PARK repeater, and are installing a high speed D-Star system (and Winlink PMBO) to support Collin County ARES.

The regional Hamfest is Hamcom, which will be held in Plano on June 8 & 9. Seeing as how you are going to be here, and seeing as how I'm still programming director, and seeing as how I'm still looking for programs, expect me to hit you up. Incidentally, they are holding a National D-Star Users Group meeting here at Hamcom this year.

1020. Fwd: [tapr-announce] Join Us at the First TAPR/AMSAT Joint Hamvention Banquet

Yahoo group: DAWG-HSMM
Date: 2007-03-11 00:41:31 UTC
From: Mark Thompson
Topic: 1020 Message: 1020

Joint TAPR/AMSAT Banquet at Dayton 2007

For many years, AMSAT and TAPR have held "competing" Hamvention dinners on Friday evening. Given the tremendous overlap in membership and interest between the two groups, this has always required tough choices. We're pleased to announce that this year, AMSAT and TAPR will be holding a joint dinner, and it will be at a great venue -- the Air Force Museum.

Here are the details:

"Dinner Under the Wings" will be held Friday evening May 18,2007 at the Air Force Museum in Dayton, OH in conjunction with the 2007 Dayton Hamvention. The doors open at 18:00 with a cash bar and appetizers in the Air Power Gallery (World War II). The buffet dinner will be served at 19:00 in the Cold War area. Following a few announcements and a short presentation you will be free to roam the museum.

Price for the dinner is $35.00 per person and includes appetizers, salad, meal, dessert, coffee, iced tea, tax and gratuity.

See http://afmuseum.com/ or http://www.nationalmuseum.af.mil/ for information about the museum.

The museum will close at 22:00 and everyone must be out of the museum by then.

Reservations are required and can be purchased from TAPR -- go to http://www.tapr.org/dayton.html for more details. There will be no ticket sales at the TAPR booth this year, and sales will close on Monday night, May 14, 2007 to allow us to give the museum a count on Tuesday.

There may also be a special showing of the IMAX movie "Space Station" at 5:00 PM prior to the banquet. See below for details.

Banquet Menu
Roll and Butter
Salad with choice of Ranch, French or Italian Dressing

Top Round of Beef w/carver
Classic Sautéed Chicken Breast in a Sun Dried Tomato Cream Sauce
Grilled Salmon Blackened with Jack Daniel's BBQ Sauce

Roasted Red Skin Potatoes
Rice Pilaf w/ Pine Nuts and Thyme

Prince Edward Blend w/ Yellow Wax Beans, Green Beans and Baby Carrots
Sugar Snap Peas w/ Red and Yellow Peppers

Chocolate Chocolate Espresso Torte w/ berries and Melba Sauce

NOTE: A vegetarian meal choice is available; if you would like this, please let us know when you order your tickets.

At 5:00 PM on Friday afternoon there will be a special showing of the IMAX movie "Space Station". This movie is approximately 47 minutes long and contains about 4 minutes of amateur radio contacts between school children and the International Space Station. The IMAX theater is located in the museum building off the main lobby area. Attendees at the movie will be able to go to the banquet at 6:00 PM when the doors open about 10 minutes after the movie is over. The lobby contains restrooms, telephones and some seating.

At least 50 people must sign up for the movie in advance. Reservations are required -- to place yours, call the museum IMAX theater on (937)-253-IMAX. Adults are $6.00, seniors are $5.50, and students 8 through college 22 (student ID required) are $4.50.

1021. 2007 ARRL/TAPR Digital Communications Conference issues call for papers

Yahoo group: DAWG-HSMM
Date: 2007-03-11 00:42:54 UTC
From: Mark Thompson
Topic: 1021 Message: 1021

* 2007 ARRL/TAPR Digital Communications Conference issues call for papers:

Technical papers are solicited for presentation at the 26th annual ARRL/TAPR Digital Communications Conference (DCC), Friday-Sunday, September 28-30, in Hartford, Connecticut. Papers will also be published in the Conference Proceedings. Authors do not need to attend the conference to have their papers included in the Proceedings. The submission deadline is July 31. The ARRL/TAPR Digital Communications Conference is an international forum for technically minded radio amateurs to meet and present new ideas and techniques. Paper/presentation topic areas include -- but are not limited to -- software defined radio (SDR), digital voice, digital satellite communication, digital signal processing (DSP), HF digital modes, adapting IEEE 802.11 systems for Amateur Radio, Global Positioning System (GPS), Automatic Position Reporting System (APRS), Linux in Amateur Radio, AX.25 updates and Internet operability with Amateur Radio networks.

Submit papers to Maty Weinberg, KB1EIB, ARRL, 225 Main St, Newington, CT 06111 or viae-mail <maty@...>. Papers will be published exactly as submitted, and authors will retain all rights. ARRL will provide additional information on the 2007 DCC as it becomes available.

1022. Request for Hamcom Presentations

Yahoo group: DAWG-HSMM
Date: 2007-03-22 15:13:40 UTC
From: J. Beadles
Topic: 1022 Message: 1022

It's that time of year! I'm putting the presentation list for this year's Hamcom. This will be the second year for Hamcom at the new Plano Centre in Plano TX on June 8 and 9. This year all parking will be on-site, which should relieve our one frustration from last year.

I'm looking for HSMM presentations, both from those of you who have presented before, and those of you who haven't but would like to. The list pf programs that I have as of March 28 will be put up on the Hamcom web site for advertising, so if you want to present, giving me your information before then would be beneficial.

Persons interested in presenting should fill out the form on the Hamcom web site. This form gives me all the information I need to schedule your presentation. The form is located at:

http://www.hamcom.org/cgi-bin/ccp51/cp-app.cgi?&pg=presenters

1028. Microwave Frequency Sources.

Yahoo group: DAWG-HSMM
Date: 2007-05-01 00:31:31 UTC
From: Phil Williams
Topic: 1028 Message: 1028

I can across a couple of microwave freqency sources that I would like to find some technical data on. The devices have a tunable cavity, operate with a -20VDC source, one SMA female connection labled RF out. The company is Frequency Sources, Chelmsford, MA. Searching the Internet did not big up any information about this outfit.

Label on device:

FS-2155-15 26629
P/N: 037-002478-002

Any help would be appreciated.

1029. 07 Wild Ride HSMM Activity

Yahoo group: DAWG-HSMM
Date: 2007-05-07 20:41:31 UTC
From: J. Beadles
Topic: 989 Message: 1029

All,

Looks like we're going to support the Richardson Wild Ride (Saturday, May 19) with HSMM again. Goal is to transport photos to a central web server, with public display of the images at the start/stop.

Anybody interested in getting practical experience with D-Star, WiFi and Winlink should send email to me directly at beadles at nortel.com no later than midnight this Thursday. I'll set up a training opportunity sometime this weekend for those responding.

Best of Luck and Have Fun.

I was trying to see if I could schedule a job at my
main office in Plano (Alcatel, oops, Alcatel-Lucent)
around that time but the schedules did not line up to
make it happen.

I work out in the field (Los Angeles based) and have
opportunity at times to bid on staging projects at the
plant. I just recently turned in work proposals for a
couple of projects for my group, one going on _this_
week.

Not the best but how about using Netmeeting (sp?) with
a headset and a usb webcam? Try it out PC to PC (with
or without a switch) to make sure it works and to get
a feel of how it works. Then extend the connectivity
with wireless access points and basic antennas within
the same room. Once you have confidence in what you
have set up, go for distance.

Some things to note or my opinions:
Impairments in the transmission path will affect your
data throughput which is why you want to get a feel
for pristine conditions on your testbench.

It helps to have a relatively new PC running at a
clock rate > 500MHz and at least 256M of RAM. and a
10/100 or even a 1G ethernet interface. The more the
merrier as it keeps the data throughput rates high and
continuous.

Use at least Windows XP. Windows 98 performance sucks
for anything close to real time performance.

There are better solutions than Netmeeting but this
keeps your initial costs low* and allows you to play
right away. There are also unix/linux solutions that
are similar; just that I cannot name any.

73,

kevin
kc6pob

*Netmeeting comes with Windows; most everyone has a
multimedia type headset that connects to the audio
jacks or via USB; and a cheap webcam.

Topic: 1038 Message: 1038

Ran across another ham tonight that wants to experiment with HSMM. We want to set up about a 40 mile link with a "repeater" in the middle on Iron mountain. My question is what would be a good, cheap solution to put on the mountain? Would we need 2 antennas, 1 pointing east and 1 pointing west, or could we get by with 1 omni antenna?
Iron Mnt is just about half way between end points.

Thanks

HI, I am Mark N5RFX and I live in Arlington and was wondering if there were any network diagrams that are available for Ham high speed networks? Is the WRT54GL the recommended router?

73,
Mark N5RFX

John Beadles web page is a good start.
http://www.n5oom.org/hsmm/index.htm

John is using the older model WRT54G which is equivalent to the WRT54GL. After Version 4 they lowered the amount of memory in the device. I think they are on version 7 or 8 now. He added Sveasoft “Alchemy” firmware to add WDS Bridging allowing a router bridge between two other routers.

I took another approach, and bought the Buffalo WHR-HP-G54 which in theory has more range and uses less power. I used the DD-WRT software to add the additional functions. We hooked them all up at field day.

John has a pretty cool system. He has the router in a weather proof box and the antenna mounted on a 10 foot antenna mast attached to a tripod. It makes a pretty fast setup since he can tie the whole thing to the roof of his SUV assembled.

Since I was new at this I was not so fortunate or quick to setup my leg of the system. First problem was the Buffalo routers ran on 3.3V not 12V like the Linksys. So instead of running off batteries, I ran off a UPS. A level or power conversion waste. I can purchase a switching power supply for about $22 which kills the advantage of the Buffalo over the Linksys for our applications.

DD-WRT is not compatible with Sveasoft “Alchemy” when trying to bridge.

So for the first link at Field Day we used John's setup, and the second part of the link we used my setup. We had to tie the two parts together with wire. (The setup had to be a dogleg because of line of sight requirements.)

Our next setup will be the Plano Balloon Festival.

I think the Linksys WRT54GL would be the next router I purchase, but I think I would stay with DD-WRT. The other thing for you is to get a directional antenna. The higher gain for directionality the better. 15 - 24db antennas are between $29 and $69, to get a 30 db is a big jump, over $200 if I remember right. The antennas on the Internet are much cheaper and have more gain than what you can get locally at Fry's or Microcenter.

We also tend to use horizontal polarity for our links so interference from home users is reduced.

I am using a WRT54GL with DD-WRT installed. When I went to Ebay to determine the current pricing of the WRT54GL, I came accross a unit with DD-WRT installed AND with a 1 GByte SD memory card installed along with software for a Web server and FTP. I'm sure you can find instructions on the internet on how to do this yourself but this company performs the mod and checks it out. It's Linux so not for the faint of heart.

http://www.tekunixcorp.com/repeater-wrt54gl.htm
http://www.tekunixcorp.com/support.htm

The capabilties of this modified unit would be of great benefit in an EMCOMM situation.

In this context we will be getting Internet access to the field where
they launch the balloons so they can have up to the minute weather radar
and wind information prior to launch.

Amateur Radio is also used for chasing the balloons.

Right, because 2.4GHz will be completely free and clear of all traffic
except for all the ad-hoc networks deployed by the EOC, EMS, FD, PD,
etc...

1047. Digital cameras at Plano Balloon Festival

Yahoo group: DAWG-HSMM
Date: 2007-08-17 18:32:23 UTC
From: J. Beadles
Topic: 1047 Message: 1047

It's time for Plano Balloon Festival again, and that brings me back around to the subject of digital video and images. For the past several years, we've experimented with putting networked cameras out at the park so that hidden parts of the park can be seen by the field and recovery ops folks (us hams).

The goal is to have low cost hardware that can run off batteries and not need dedicated PCs (unless they are low cost and battery driven). The units need to be stand alone and as maintenance free as possible for 3 days (the duration of the festival). It should be capable of low-light operation, and have the ability to swap out lenses (C/CS mount preferable). Most of all, it needs to be cheap enough so that several can be set out.

It has proven remarkably difficult to do this, for the following reasons:

1. Typical webcams as might be found on a PC provide pretty low quality images (and require a computer). The lenses on them are intended generally for people sitting in front of the computer, not to cover an area the size of several football fields, and they generally have poor low light capability.

2. There are a number of network cameras on the market. My experimentation with the lower cost d-link cameras was very disappointing. Generally, they could not transmit frame grabs (video only) and died in a short period of time. There are more, maybe they got better, but are intended for short distance indoor use, and don't have lens mounts for outdoor use. There are a number of IP video cameras for outdoor use, but virtually all are out of my price range (>$400);

3. Frame grabbing has gone out of style. There used to be frame grabbers that would take pretty good pics (such as the old Snappy device). Now the market has gone to live video capture, with framegrabbing as an afterthought. I did some expensive experimentation with some of the USB video capture devices. They did provide 320x240 frame grabs, useless for my purposes. In any case, this still requires a camera, so isn't very useful.

There are ways to use a camcorder attached to a laptop to grab really high quality frames. However, we're back to having a dedicated computer in the field, not what I want.

When I experimented with this last, there was a a standalone ethernet video device on eBay, about the size of two boxes of playing cards. This $99 box would take up to 4 cameras and dump live

video out the port, and would also take frame grabs. Unfortunately, the firmware was very unstable, and it would lock up if you blinked at it wrong.

4. Another issue is what to do with images or video once you have them? At the Plano Balloon Festival, the launch field is virtually always in a NATted subnet. Images can be made available off the field by FTPing them to an off-site web server. Video is harder, however. There are streaming video servers that we could use, but I don't know how to use them yet. Cameras or other devices that serve video directly can't be accessed off-site unless special provisions are made to open the network to that server. Given the nature of our internet feeds, that generally won't happen.

So, what next? Well, right now I have a good quality low-light security camera. Recently I've run across the "Hava Gold" (http://www.myhava.com/products.html) product at Frys for about $129. It is a commercial entertainment product - you plug the video and audio out of your TV into it, and it serves it across the internet to an unlimited number of clients. It still suffers from the NAT issue above, but should work well across the launch field. The specs say it comes with a 9v 1amp power supply, so it should work ok from battery power.

Sorry Mark, just saw your msg. We perform a safety backup function for the balloon flights during the 3 day event. We have two operations, one at the launch field, and a recovery operation out in the local area. The field ops group tracks the balloon vehicles on and off the launch field, and records the numbers of the balloons that fly. This information is transmitted to the recovery group which ensures that all of the balloonists are safely recovered by their crews.

The festival area has become very densely suburban, with more houses, powerlines and fewer landing fields. Most of the balloons aren't from here, and aren't familiar with the area. It's easy for a balloon to be separated from their crew. We help them link back up, and are in a position to call for emergency services if any are needed.

John:

I know you said early in your message that you'd rather not use an implementation that requires dedicated PCs (& their associated batteries), but if you do end up going down that path, the "Disposable Video Camera" from CVS Pharmacy makes a very nice, inexpensive (approximately $30), good resolution (standard 320x240, adjustable up to 640x480), excellent auto-shutter light controlled (down to approximately 15 lux or less), modifiable to create a USB-interfaced "webcam" style input device.

There are third-party drivers available that let you use this camera as a webcam & also third-party software that lets you "adjust" its resolution & frame-rate. It's been about a year since I bought a new unit, so I'm not sure what the current state-of-affairs is as to "unlocking" the current cameras (each time the manufacturer brings out a new version, some time must elapse before the software unlock mechanism is discovered & refined).

More info can be found at the following URL:

http://camerahacks.10.forumer.com/index.php?c=5&sid=c1925f2d99c5b73df656d859e9d685a2

We've used one of these cameras on several amateur radio experimental balloon launches, so far only as a video recorder & as a pseudo-still camera. We have future plans to fly one along with an embedded PC compatible card & stream video back to launch-central via 802.11 throughout the entire flight.

Let me know if you need any further info (again, if you end up using dedicated PCs).

I've seen that. It looks like a nifty way to use that camera. Not suitable for this application, but great in the way you described.

Now, it may be practical to use one of these 12v micro PCs, but it'll have to have a digitizer that runs under linux to keep the cost down.

1051. HAVA platinum HD

Yahoo group: DAWG-HSMM
Date: 2007-08-23 05:07:01 UTC
From: J. Beadles
Topic: 1051 Message: 1051

Picked up a HAVA Platinum HD at Frys over the weekend. Got the platinum because it provides DVR functionality. Finally got it hooked up, and yes, it does work pretty well. The documentation says it uses something up to 6 mb/s. Seems to have about 6 seconds of delay between the live signal and the transmitted signal.

Nope. Good point. It has component video I/O though. I seem to recall that the HDMI interface has a built in mechanism to prevent copying, and since the HAVA permits any number of clients, HDMI may not be in the cards.

Hi guys -

Good to hear from you, Matthew! And you too, Bill. There's plenty of 900MHz miniPCI transceivers available now at reasonable prices. That's the good news. The bad news is that the FCC is entertaining new "etiquette" rules for the 902-928MHz band, and these rules could have a serious negative impact on products like these. Basically, it says that the more power you use, the less duty cycle you should have. Kind of a time averaged maximum output power. So if you want to transmit at significant output power (like a watt, the maximum allowed in the band for Part 15 devices), you'll have to have a low duty cycle, which could have a strong impact on your throughput.

Part of this is because of an entity called "Telesaurus" which owns some significant licenses for the 902-928MHz band, but only as a secondary user. They would like to remove the constraints on their use of the spectrum, essentially giving them a primary status, which would severely impact all other users. Please check out the FCC 07-117 document for a bit of history and the FCC's concerns.

Here's the link to the FCC NPRM:
http://fjallfoss.fcc.gov/edocs_public/attachmatch/FCC-07-117A1.pdf

I would recommend that if you have an opinion on this (and most of us probably do), please file comments with the FCC before the due date.

Sincerely, Jon N7UV

Here's a fine summary of the issue from Mitchell Lazarus (a friend of mine and an excellent lawyer in DC):

"The FCC has proposed a "spectrum etiquette" to govern unlicensed operation in the 902-928 MHz band, and possibly in the 2.4 and 5.7 GHz bands as well. If adopted, the etiquette would amount to the biggest change in unlicensed usage since the approval of high-power spread spectrum 22 years ago.

As explained below, the proposal threatens to split unlicensed users into warring camps. If adopted as proposed, the etiquette would have its worst impact on users who operate at high power all the time, primarily the wireless Internet service providers, or WISPs. The main beneficiaries would be applications whose transmissions are of very low power and/or short duration. But the vast majority of unlicensed users fall somewhere in between. They, and the manufacturers who supply them, should carefully work through the effect of the FCC's proposals on their own operations.

Comments are due on October 15, and reply comments on November 14. Companies that care about the outcome can have the most influence by setting out their positions in the first round of comments, and using the second round to challenge those who disagree.

An Etiquette -- Who Needs It?

The term "etiquette" in this context is similar to its near-synonym "protocol," as used in telecommunications. Both words refer to pre-arranged steps for setting up a communications link, although an etiquette tends to be less interactive.

The need for an etiquette -- if there is one -- arises from worsening congestion in the three unlicensed bands earmarked for the relatively high power of one watt: 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz. The first two of these carry most of Wi-Fi, all of Bluetooth, ZigBee, other industrial controls, active RFID, meter-reading equipment, wireless Internet access, amateur radio, and various other licensed services, not to mention countless consumer goods: microwave ovens, cordless phones, nursery monitors, wireless audio gear, and much more. A typical home might have half a dozen or more of these products.

The FCC regulates unlicensed devices mostly on their overall properties, as by setting maximum power and minimum bandwidth. With exceptions, the rules are silent on the details of operation. Yet, despite the near-lawless environment and vast numbers of users, unlicensed communications work pretty well. Manufacturers usually throttle back the power to far less than the rules allow, mainly to extend battery life; but as a side benefit, this practice also limits potential interference to a small area. Another way to save the battery is by keeping transmissions short, and this likewise cuts down interference. Some unlicensed technologies, including Wi-Fi, automatically shift their communications to less crowded parts of the band, enabling multiple users to work around each others' signals and operate successfully even when close together.

Relatively few users, such as the WISPs, exploit the maximum permitted power, and also transmit continuously. The WISPs are mostly small companies that deliver broadband Internet to homes and businesses, particularly in areas beyond the reach of DSL and cable. In the past they have received encouragement from the FCC, which favors widespread, competitive broadband services.

The WISPs generally use directional antennas that focus the transmitter power into a narrow beam, enabling them to reach distant customers. But the resulting high energy can affect other unlicensed devices in the antenna path, sometimes miles away. Similar problems can arise from Wi-Fi access points, especially the higher-powered units installed in some public outdoor areas. Being non-directional, these affect other devices in all directions, although over a smaller radius.

As WISP operations have expanded in recent years, other unlicensed users have increasingly experienced interference. Today the most popular WISP transmitters occupy 1/3 or less of the band. But nothing in the rules prevents a single user from taking up all of the frequencies across the entire band. That would effectively close off the band to others across a large area.

An unlicensed user suffering interference, regardless of its origin, has little recourse. The label on every cordless phone and Wi-Fi laptop says it all: "This device must accept any interference received, including interference that may cause undesired operation." Anyone complaining to the FCC will get a polite response, but no help.

Despite that rule, the newly proposed spectrum etiquette is meant to help protect some unlicensed users -- those that interfere less -- by reining in some of the applications likely to cause them harm. At the same time, of course, those measures will cause harm to whatever applications they restrict. Finding the right balance will not be easy.

Questions to Ponder

The FCC's inquiry begins with three overarching questions. First, is an etiquette necessary? Second: if so, to what bands should it apply? The FCC's first thought is to impose an etiquette, if at all, only at 902-928 MHz. This is the favorite band of the WISPs, as these frequencies can penetrate most buildings and some terrain. The band is also home to a lot of RFID and control equipment used for pipelines, electrical utilities, railroads, and other safety-conscious industries. But the FCC is also open to requiring an etiquette for 2400-2483.5 and 5725-5850 MHz. Third, asks the FCC: what kinds of signals should be subject to an etiquette? Most high-powered unlicensed signals are of three types: frequency hopping, direct sequence, or what the FCC confusingly calls "digital modulation," which includes the OFDM waveforms used for high-speed Wi-Fi. The FCC is inclined to exempt frequency-hopping transmitters from an etiquette, considering that the rules already prohibit them spending more than a small fraction of their time on any one frequency.

In case it decides to go forward, the FCC has listed several ways in which it might implement an etiquette. Any or all of these could turn up in the final rules.

The most controversial element would limit the "duty cycle" --the percentage "on" time -- for higher-powered units. As one example, the

FCC posits that a transmitter operating at 1 Watt (the maximum) might be allowed to run only 10% of the time. A unit at or below 1 milliwatt (1/1000 Watt) might permitted to operate continuously. In between, the percentage would scale upward for lower powers, according to some formula. All percentages would be averaged over 0.4 seconds, a number that already figures prominently in the technical rules.

No form of this proposal is likely to sit well with the WISPs, as it would drastically cut the data speed they can deliver to subscribers. It would also impair devices such as the now-ubiquitous Wi-Fi access points. Because these typically operate at a few tens of milliwatts, the proposed etiquette would silence them for some fraction of every .4 seconds. This may not be noticeable in a home network. But in an office or coffee shop, where an overworked access point might download simultaneously to a dozen or more laptops, a restriction on duty cycle would result in longer waits for email and web pages.

If the FCC does limit duty cycle, further questions arise. Should a transmitter be allowed to vary its power and duty cycle, so long as the two collectively comply? (Sure.) Should several high-powered units, each on a limited duty cycle, be allowed to synchronize their transmissions? Perhaps not. This would enable unit A to transmit during the required quiet times for units B-J, and so on for B and the others. A user could bypass the rule simply by collocating multiple transmitters.

Another proposal would require an unlicensed device to have "listen-before-talk" capability, so as to avoid stepping on other users' transmissions. Wi-Fi transmitters already have this feature, but they use it for selfish purposes, to help ensure that the sender's transmissions get through. The proposal would require a more altruistic implementation, to avoid interrupting other people's communications. The idea is not new. The FCC requires listen-before-talk in unlicensed radios using parts of the 5 GHz U-NII band, to protect the federal radars left behind when the band was reallocated to private use.

Surprisingly omitted from the FCC's proposals is "automatic power control," which continuously adjusts transmitter power to the minimum needed for communication. The technology has long been standard in cell phones, both to extend battery life and to let providers adjust cell sizes as needed, and is also required in the U-NII band. Automatic power control has the unique advantage of minimizing interference to others without any impairment of the device's own performance, and it extends battery life to boot. The chief downside is a more complex circuit design, which translates to higher costs for the device.

Let the Debate Begin

Proceedings on the unlicensed rules tend to be controversial. The vast diversity of users and manufacturers lead to widely divergent interests. The licensed users in the bands, particularly the amateur

radio community, tend to have strong views as well. If the past is any guide, the FCC is likely to receive thousands of strongly-worded comments, all advocating inconsistent positions, each one predicting the downfall of Western civilization if the FCC fails to follow the author's advice.

The folks at the FCC will try very hard to reach a workable result. But the quality of their ultimate decision depends on the quality of the information they receive. Those with an interest in these bands who fail to speak up have no right to complain about the outcome.

1055. 802.11b and satellite operations

Yahoo group: DAWG-HSMM
Date: 2007-09-24 01:04:08 UTC
From: kf4yfd
Topic: 1055 Message: 1055

I was wondering about the following technical problem involving 802.11b/g and satellite downlinks in the 2.4GHz band:

I want to setup an 802.11b/g HSMM repeater on what would be channel '-1' at 2402MHz and channel '0' at 2407MHz.

My concern however is with interference _to_ satellite operators. Currently there is only one operational satellite with a 2.4GHz downlink: AO-51 at 2401.200MHz FM. Phase 3E however will be launched soon and have a linear passband with downlinks near this same frequency.

The HSMM system will be transmitting approx 1 Watt PEP across 22MHz (low power density) with gain towards the horizon. With certain satellite passes the satellite operators antenna would be pointed directly at
my HSMM antenna. This is my concern, if my HSMM antenna is directly in the line-of-sight path from the satellite to the satellite-operator could satellite operations still continue or would the narrowband receiver be saturated with my HSMM signal?

Has anyone experimented with this before? I apologize up-front for not knowing the math to calculate this myself.

These are good questions, but before I even try to answer them,
how about these question?:

If you know the satellite operator within short ground wave range of your HSMM node, why not just have him give you a phone call whenever the rare event takes place that he is both operating a satellite mode with a 2.3 GHz downlink AND you are in his line-of-sight to the bird? Then you can just shut the HSMM mode down as a courtesy for the brief 2-3 hours in maybe a month in question?

In other words, don't try to solve the problem, before you know it to be a problem.

73,
John - K8OCL

PS - The majority of Part 15 operation is on Channel 6 (80%?). It is the default channel for Linksys and many other APs. About 10% are defaults to Channel 1...that's a problem.

The near-far phenomenon: Chances are that a nearby neighbor running a mere .1 watt on any channel (remember the sidebands!) will clobber him long before your 1W at several mines will even be noticed. Depends on the area in which he lives and how much WLAN activity is around, etc.

If you are running an amp or any kind, we always recommend using an inexpensive passband filter to keep your sidebands within the Amateur Band.

Randy,

Well, it is only really needed when using a BDA because the sidebands are stronger too, of course.

I want to write that I saw them at FAB Corp, but I don't think so. There is another vendor that had then for ~$60. My HSMM node is up and running in Richardson on Channel 3, but it is barefoot. If I want to run my 802.11b 1W BDA guess I'd better re-find that source! (HI)

JohnPS - I am using WEP with the old published key (HSMM-). SSID=k8ocl

1060. 802.11 "mobile" access point

Yahoo group: DAWG-HSMM
Date: 2007-09-24 17:04:32 UTC
From: John Barrett
Topic: 1055 Message: 1060

I've been working on a portable tower for ARES and public service work, and am getting close to the point of installing and integrating the on-board radio and computer systems, and one of the things I've planned is an access point to support WinLink/Postoffice mail access

I have a Linksys AP that I'm planning to use, and would like some suggestions as to antenna configurations that would make the best use of that I've got available.

For permanent antenna mounts, I have several locations at about 10ft height, which I was considering for one or more omni antennas, and I was thinking about a dish or yagi to mount on the tower at 30-40ft height, possibly with a 500-1000mw booster at the antenna.

So - here are the questions :-)

1. is it worth having a second AP so I can run the local/omni antennas with diversity and separate from the directional ??
2. If a second AP is needed, whats currently the best out there for features (hardware/firmware)
3. should I consider boosters for the omnis ??
4. any other ideas that might make this a more versatile setup ??

How far do you want to go? 2.4GHz is pretty much line of sight and
trees and buildings block it. So height is the key. We used 15 db
antennas, but also have 24 db antennas, which are not too expensive
(approx $80). When you go to 30 db antennas it jumps to over $200

Yes, but I would wire them to the other router and have the local on one
channel (6 or 11), and the directional on another channel (1). I would
keep the local ones with unmodified HW so they are not considered
Amateur Radio Gear and let local ones link together with WDT, and as
soon as you add the directional antenna to the long range one it is
Amateur Radio Gear.

> 2. If a second AP is needed, whats currently the best out there for

Get a router that is supported by DD-WRT, and load DD-WRT in place of
the manufacturers software. That is what we used at the Plano Balloon
Festival this weekend, and it went together pretty easily. Do a Google
search for "DD-WRT"

All 5 of our routers had the same software even though they were Linksys and Buffalo brands.

Running WDT (a feature with DD-WRT) on both lets you easily connect other routers with a wireless backbone, as opposed to regular routers that assume wire as the backbone.

We also like to use vertical polarity for loc
If money is no object, the Linksys WRT54GL ($80 at Frys, as low as $52 on line) has the most memory for a bigger software download and so you can get the standard version of DD-WRT working. The newer Linksys and Buffalo routers only let you load the mini version of DD-WRT. But that was sufficient for what we needed at the Balloon Festival. And may be sufficient for what you need also. Read up on DD-WRT.

> 3. should I consider boosters for the omnis ??

It is up to you, but we did not. DD-WRT lets you set the power level. However if you set it too high the board may not cool the chips enough. I would say no mods for the local ones and use the antenna that comes with it.

> 4. any other ideas that might make this a more versatile setup ??
>

Running WDT (a feature with DD-WRT) on both lets you easily connect other routers with a wireless backbone, as opposed to regular routers that assume wire as the backbone.

We also like to use vertical polarity for local as that is what is normal for WiFi, and horizontal polarity for the long point-to-point distances for less interference.

Running the stock antennas is NOT an option.. the routers are going to be mounted in a steel cabinet :-) and the cabinet is only about 5ft off the ground at its highest point.. so I'd lose a lot if I don't get the antennas up a little higher, and somewhat away from all the steel --- getting them up on the "riser" that supports the tower will at least clear 90% of the metal and get me an antenna on either side of the tower riser for complete coverage. A few extra DBi wouldn't hurt either :-)

Cooling is going to be an issue no matter what I do - even with the 400 cfm ventilation fans I'm installing - will probably end up popping the covers off the routers to give the chips a chance to stay cool :-)

I guess I missed what you were trying to accomplish with the "local"
systems.

What range are you trying for and how much are you planning to spend per
node for the local systems?

Why are you using steel cabinets?

You do realize as soon as you modify the equipment, only hams can use
it, and anyone without an Amateur license can not use it.

Ohhh how best to explain this - right now I have a single wrt54g, I had originally planned a setup that would go in my jeep to provide access to a winlink/postoffice setup, with a couple of mag mount whips on the roof of the jeep. I still want that, but transferred to the trailer, but with one or more higher gain omnis higher up for better "local" coverage. Since the 54g has 2 antenna ports.. I was asking if I should use one for a directional backbone link, or get another router for the backbone - that part has been answered - already hunting ebay for a 54gl.

The question now becomes, does adding high gain omni antennas to an unmodified router constitute a "modified ham-only" setup - probably not since plenty of antennas and amps are sold openly. so the only mod that seems to count is the firmware mod to make it "ham only" ??

Sold openly does not insure adherence to FCC rules and regs. :-)

Since this is a part 15 device, you have to follow part 15 rules to
keep it as such. You can get "high gain" omni antennas but they are
supposed to be designed for a specific products (maybe set of products).
To add some other antenna not specifically designed for a given Part 15
product supposedly violates Part 15 and now, if you're a ham, you use
it under Part 97.

I'm sure amplifiers (I haven't seen any in this country) are handled
the same way.

This is my understanding from one of the session on WiFi at HamCom.
Your mileage with the Friendly Cookie Company may vary. :-)

If I recall correctly, they tweaked the rules to Part 15 to say that
you can mix antennas/radios/amps, but at that point it is up to the
operator to ensure that they are operating within Part 15 rules. So
you can take an 8 db omni and hook it up to the linksys (or whatever
flavor you choose) and as long as you ensure that the radio output
power is low enough to stay under your 36db eirp limit, then you are
still operating in Part 15.

As for the DD-WRT software, I have only used it briefly, but I dont
recall anything about it being Ham specific. It just lets you
tweak/change a ton of settings that is not possible in the stock
router software.

It is true that the FCC did modify the rules to allow some
flexibility in antenna selection. However, the rules as I read them
only allowed for swapping within the same accepted type of antenna.
For example, if a radio was accepted with an 8db omni, that does not
permit you to use a 10db omni or an 8db panel. I can't recall I
ever saw anything about power amp swapping. Also, if the radio
isn't accepted with a power amp, you can't use on in any case and be

part 15 legal.

Only if it was accepted with an 8db antenna to begin with. The antenna they sell is a 7db, I believe. It's a finicky detail, but there it is.

Technically, it's not. However, it does allow you to change the xmit power. Doing this takes you out of the part 15 rules. Lots of people do it, but that doesn't make it legal.

A good note about the DD-WRT firmware is that it appeared to allow the radios to WDS bridge at a much lower SNR than the Sveasoft Alchemy did. (or maybe they are displaying the survey readings differently.) I'll have to flash the APs on the Eiseman center and our building here to see if they can now bridge in spite of the ambient noise.

==========

Welp - my wrt54gl is on the way, already loaded with OpenWRT, but that's easy enough to change, I guess I'll use it for the local access point, and use the wrt54g I already have for the interlink (unless there is some reason to have the full DD-WRT vs the lite version on the interlink)

Now just need to pick out an amp and an antenna for the interlink :-) Then comes the fun part - working out a mount to attach it to my tower pointing

in any direction :-)

I've got a scrap Dish since we switched to FIOS - what might be involved in getting that up for wifi ?? or should I save it for microwave stuff and just buy and OTS yagi or grid dish ??

I'm probably going to mount the local AP in an enclosure closer to the antennas with POE.;.;.; going to need to locate some RP-TNC to N pigtails for that setup..

Excellent time for a Garage Sale of this stuff! The Lone Star DX Association quarterly luncheon is also this Saturday in Arlington. Hummmm? Buy a 5 element 20 meter monobander cheap or go talk trash with a bunch of other DXers? Unfortunately, that antenna would consume my entire residential lot.

If you are going to use a dish or yagi, that means you are going point-to-point. The higher the gain, the narrower the beam width. And the narrower the bandwidth, the more difficult it becomes to point.

I like the 14dbi Rootenna because it has a 30 degree horizontal and vertical beamwidth. It makes pointing by hand easier. They have a higher gain unit but the beamwidth is narrower.

The folks at the North Texas Microwave Society have adapted the Dish dishes to work with a 2.4Ghz feed but it's a mechanical challenge. For use as a portable ARES unit it's not recommended. And since it's an offset feed, it's difficult to point.

Are you working for a permanent installation on your house or are you working for a portable unit that will have to be erected on location? I'm having trouble understanding what you are designing.

I have a new, unused weather resistant plastic lawn sprinkler control box like the one N5OOM used on his first versions that can be yours for cost.

The beam will be mounted to the side of a triangular tower section..
probably at one of the corners, with a home-brew azimuth rotator for getting
it pointed right, since there will be no access to the antenna when its
cranked up 30+ feet in the air :-)

Portable is relative - I've got about 100 cuft of cargo compartments to
stick stuff in on the trailer (2x 5'x5' decks about 20" high each) --- if it
can be stashed in the cargo compartment, or stored in one of the cargo tubes
that I plan to add for stuff longer than 5ft, and attached to the tower in
less than 15-20 minutes.. then its portable :-)

1074. WIFI Card recommendation

Yahoo group: DAWG-HSMM
Date: 2007-10-11 14:44:07 UTC
From: Jerry Karlovich, KD5OM
Topic: 1074 Message: 1074

We were at Inks Lake SP this last weekend and was hoping to take advantage of their free wifi. My ever so wonderful HP card didn't do so well. I almost had to be within a hundred feet of the source to connect. Where as the campers next to me were able to connect from their campsite. (She was using a MAC notebook). Are the any reviews on PCI wifi cards for notebook computers listing their ablility to hear a distant wifi sig. Or can I have some recommendations for a really good PCI card for my notebook. I have a Dell running XP sp2.

While at the park and just for a few minutes I was picking up a bridge. What would be involved with a bridge up on my 18' push-up painter's pole I normally have my Buddie-pole antenna on?

Jerry,

My recommendation is to get a USB type device with a cable and then put the antenna in the window. You can move it around that way and also use an extension cable to put it outside of the RV/trailer if needed. Here is one by Linksys http://www.linksys.com/servlet/Satellite?c=L_Product_C2&childpagename=US%2FLayout&cid=1160093476789&pagename=Linksys%2FCommon%2FVisitorWrapper&lid=7678939789B30

Jerry,

One thing to keep in mind is that you not only need to be able to hear the access point you are trying to connect to but the access point must also be able to hear you. Most consumer wifi equipment puts out about 14dBm (25mw) http://www.fab-corp.com/pages.php?pageid=1 of power. This may not be enough to get your signal heard in fringe areas. I have used many Proxim/ORiNOCO/Lucent cards http://www.proxim.com/products/cp/pc.html and have always had good luck. They put out between 60mW and 100mW depending on the card (check the datasheets for any of the cards).

Another plus is that they have an external antenna connection on the card (MC if memory serves me) and I have a mag mount antenna that I got from FAB-Corp that works well to pull in those weak signals http://www.fab-corp.com/product.php?productid=1659&cat=282&page=1 looks like they are discontinuing them though.

Hope that helps,
Keith

There are a lot of ways to skin this cat.

At the Plano Balloon Festival the church had WiFi but we could not access it from the roof where our antenna pointing to the field was located. We were able to place another router where we could get signal and ran a wire between them. It also changed the frequency as the church was using channel 6 and we wanted to use channel 1 for the Balloon Festival.

I was able to get the church directly on my laptop at the operations tent, which was 2500 feet from the church because the church was clear line of sight and I had a 15 db gain antenna on the church pointing my way.

The first thing I would try is to get a router that is compatible with DD-WRT software and put it up in the air and run a Ethernet cable to your laptop. You could set it on the top of your RV or hook it to an antenna mast. The higher up the better. That will probably do it.

The second option would be to add an external directional antenna to the router. A 15 db yagi is around $30, and there are sometimes deals on other ones. Look at http://www.hyperlinktech.com and http://pacwireless.com

A third option is to do exactly what we did at the church, get two routers put one high up and the other to broadcast to you on another frequency so you do not have to have a wire to your laptop. (Like a repeater.)

If you want to borrow one or two routers to play with let me know.

Kip

That's exactly what I did for my 3 month RV trip to Alaska!

I used a Linksys WRT54GL loaded with DD-WRT used in the bridge mode. I used one of the yellow push-up paint poles from Home Depot as a mast which was mounted in a flagpole holder attached to the ladder on the back of my trailer.

The linksys was installed in a Pacific Wireless 14dbi Rootenna at the top of the mast. I used Cat-5 wire to bring the signal into the trailer and to send power up to the Linksys. I made an inexpensive Power-over-ethernet (POE) splitter using an RJ-45 Keystone connector which I can leave permanently installed in the Rootenna with the Linksys.

At the bottom end I have another POE splitter to combine the data and power to the Cat-5 cable. I use a Cat-5 crossover cable to bring the data signal to the LAN input on my laptop.

It takes me about 15 minutes to set up the rig. I have to mount the Rootenna on the top of the mast, set the mast in the flag pole holder on my trailer and feed the Cat-5 cable thru a window. From experience, I learned that I could put a piece of duct tape over the small opening at the window to prevent rain from getting in.

With WiFi, line of sight is very important. I found at campgrounds the tree and larger RV would block the signal. The quality of the installation of WiFi in RV parks varies. At the high end I have found well engineered systems with directional antennas mounted high and boosters. At the low end, I found several parks that have an Access Point inside the building on the desk by the computer. When choosing an RV park that advertises WiFi, be sure to query them about the antennas.

I like the 14 dbi Rootenna because it has about a 30 degree horizontal and vertical beamwidth. That makes it easy to lineup. The higher gain antennas have a narrower beamwidth making their aiming a little more difficult.
http://www.pacwireless.com/products/RT24.shtml

If you decide to go this route, I'll be glad to help yiou.

If you don't want an HSMM project where you have to set up a waterproof, power-over-ethernet custom flashloaded Linksys router there are a couple of things you can do. One is to get a high power card. I found several 200mW cards at HamCom for $5.00 each. They were SMC high power 802.11B cards that have firmware supporting WPA so they are the last evolution of the wireless B cards. They have a detatchable antenna using RM-MMCC connectors. PacWireless has a nice RP-SMA folding antenna that mounts on the laptop. It can be configured with any type of pigtail you wish. This card has worked very well for me even on a fussy Compaq laptop. I give it a 9 out of 10.

See:
http://reviews.cnet.com/adapters-nics/smc-smc2532w-b-2/4505-3380_7-21183545.html

EPAY (or "Everybody Bids Against You") currently has one up with a starting bid under $10.00. See: 26016864807

Antenna: http://www.connexwireless.com/products/RV24-5RD.shtml

The seatlewireless web site lists a lot of hardware specs, including tx/rx for many many cards. I'm not sure how current it has been kept but it would be a very good start.

I think I like Doug's solution best. A gain antenna on a mast allows me a bit more flexibility at the camp grounds so I don't need to restrict myself to a site close to the source. Although there are only a few parks with wifi, Inks Lake is a very nice park right in the middle of the Texas Hill Country and has 2 wifi access points. Only problem is if you're relying on your on computer wifi card, you only have a small number of campsites to choose from. Having an antenna on a 20' mast solves the problem. I can also add another wireless router to repeat the signal, I think.

I just replaced my old Netgear 802.11b wireless router with a Linksys wrt54g so if anybody want to buy a really cheap 802.11b I have one. I see they're not very popular on ebay.

Doug,

When you get a chance let me know which one of those antennas it is from that web site that I need. I have no issues re-installing the board inside their antenna box.

Jerry Hi - can you outline the steps to use a second wireless router to make a repeater system? I live less than 3 miles from my work and have cable modem at home and dialup at work. I have a ham friend who lives exactly between the two where I can setup a second router to forward the signal but have never done this so help would be appreciated. It would be nice to have faster Internet at work Thanks 73 Johnny KD5LWU Cortez, CO

The main thing is Line of Sight. WiFi does not go through trees.

I used DD-WRT software in a Linksys or Buffalo WiFi Router. Check the DD-WRT website to get a router that is capable of loading their SW. They have different loads, you will be fine for this application with the mini load.

The way I would recommend would have 4 routers with directional antennas.
At work you have a router (1) with a directional antenna pointing towards your friend's house. At your friend's house have a router (2) with a directional antenna pointed towards work. This is the first link.

The second link is a router (3) with a directional antenna from your friend's house pointing towards your house. And a fourth router (4) at your house with a directional antenna pointing towards your friend's house.

DD-WRT can make the router act as a host (like a normal router) or as an access point (like your computer) Make Router 1 and 3 Access points and Routers 2 and 4 normal router functions.

For that distance a 15 db antenna should work fine. With the wide 30 degree beam it should be easy to point. I would put them up with horizontal polarity (to have less interference from others). And have one link on channel 1 and the other on channel 6 to keep them from interfering with each other.

Since one router is an access point, it can plug into the routers WLAN input and will be treated as the Internet source. Which is what you do at your friend's house with the two routers. The DD-WRT also does NAT, so your home network will be 192.168.1.XXX, The Access point at your friend's house will translate to something else, 192.168.2.XXX, the router could change it to a third range 192.268.3.XXX, and then the access point at work will change it to a 4th network 194.168.4.XXX which can be used for all the computers at work.

Again the main thing is clear line of sight, will you be able to see the antennas at work and at your house from your friend's house? How high up will you have to go?

Kip

Kip,

I like skinning Kitty Cats. They taste like chicken.

Anyway... I got me another WRT54G Ver.2 and now I want to load the DD-(what ever it was) firmware on it and do some experiments. This weekend might not be good for we plan to go to the Waxahachi Festival on Saturday (it's a couples thing) and the rest of the time it is a DX Contest weekend. I just need about 6 more to claim my DXCC :) . We don't have another camping trip planned but I think Thanksgiving Weekend will be a good time to go camping. I would like to have it all debugged and working by that time.

See ya,

Jerry KD5OM

Hello Doug and the Group

I'm an LMR tech at Kennedy Space Center in Florida and your fellow Ham. We have a church-based Ham group that responds to disasters to make sure that everyone is OK and accounted for. Then we set up disaster relief centers to handle whatever is needed.

HSMM seems to be the cheapest and most efficient way to connect these centers to the outside world in the absence of power and phone lines.

I'm looking forward to learning about your research in this field.

Best Regards

Hello John,

No problem. You can borrow my equipment and, given sufficient lead time, I can give you a description of each piece of gear. I also have practical experience with the Comet 2.4 Gig spring base mobile antenna. Works like a hose. We use HSMM at the GARC field day site to run FD-Network software which creates a wireless client server based contact logging system. We put a laptop at each radio and have the server in my trailer. The modified LinkSys WRT-54G access point router is in a Demarc Tech NMEA-4 box up 15 feet on a power generating windmill tower. We use 2, 8 dB antennas with a 12 degree down-look to cover the 1000' FD site without blowing RF into surrounding neighborhoods. The unit uses PoE and all Ethernet connections are water proof using IEC IP67 rated harsh environment / waterproof connectors. PoE injection/dejection is accomplished by Demarc Tech voltage agnostic PoE injector/dejectors.

See:
http://www.bb-elec.com/bb-elec/literature/ENxxHarshDutyCables-0903.pdf

I am also experimenting with Amphanol's new harsh environment connectors.

See: http://www.mouser.com/catalog/631/1037.pdf

For field deployable HSMM, I am of the opinion that use of harsh environment connectors is a requirement, not a luxury.

73,

RD

1096. NCTECH program for Saturday

Yahoo group: DAWG-HSMM
Date: 2007-11-07 02:30:28 UTC
From: David Johnson
Topic: 1096 Message: 1096

There will be a TBM Communicator information table set up for NCTECH Hamfest this Saturday. I'll be on site for the ham-fest. Look for me there. There wil be some good forums and presentations.

Keith Pugh W5IU for AmSat is presenting and will be able to speak to such topics as the Phase IV satellites designed for Disaster Relief Amateur Radio operation and many details on getting started with satellites.

Tarrant County RACES will be show-casing the new communications van purchased with grant money.

ARRL North Texas Section Chairman Tom Blackwell N5GAR will be speaking and will have an ARRL table there.

Jim McLeland will be presenting the latest in D-STAR digital voice operations.

There will be several vendors peddling communications equipment.

There will be a VE Exam Session by the W5SJZ Lockheed Club Team.

Details and directions at http://www.wc5c.org

I hope that you will not do yourself a dis-service for following the advice. I know the candidate for vice-director and he can not come close to doing the job that the current vide-director is doing. As for W5TEM, again I can't see his qualifications for being all that great especially against the current director who has worked so hard to get the ARRL Staff and Executive Council to start listening to the directors and members.

We are fortunate to have a director on the Executive council which not new/junior director is going to be appointed to and in fact ARRL members need to understand that it is really the Executive Council that runs the ARRL NOT the directors per se. The Council guides the Staff and if the staff fails miserably, then it is the Executuve Council that will replace them. We have seen the council's work already this year and you can expect to see more actions next year as long as the majority of the council remails the same. If we elect a new director, the council will shift back to the old school of ARRL thinking.

I di understand that the NTX manager is cross ways with the other managers and current director and vice-director but I think only because he want's the division director's position and needs a lack luster director in place so he can run as director.

You seen the same thing with ARRL directors as you see in government...most of the current directors are very liberal and a few are conservative but others are moving that way or at least seem to be, You need to ask individuals running for director/vice-director how they would change the League and the league's way of thinking. Just having ideas means nothing unless you have a majority of the Executive Council on you side...a new director won't.

The League is more political than the federal or any state or local government and Tom knows this and its his reason for proposing "his" candidates.

We now have a notice that the D-STAR grant that Ed McGinley, W5ETM, applied for was approved. It is $99,000. I think he has shown a continuing ability to 'get things done.'

Walt DuBose wrote:

But Walt, I've had a lot of success getting the ARRL Staff to listen to me.

That suggests that I am "cross ways" with the South Texas Section Manager. That is not true. We have worked together closely on important matters. He and I have endorsed the election of Ed McGinley and Dr. John Teer. It's time for a change. Members have not had a contested election for Director and Vice Director with ballots since 1998. The others have had their opportunity to perform. There are reasons why we can not be satisfied with their performance that would extend another 3 years - - to January, 2011. There are issues identified here that have not been resolved:

http://pages.sbcglobal.net/tom.blackwell/2007-arrl-election.htm

> but I think only because he want's the
> division director's position and needs a lack luster director in place so he can
> run as director.
>

I can't agree with that, either.

Yes, there were some people who asked me to run for Director this time, having seen what they have seen. But I declined to run. I had other

important commitments on my calendar. With a qualified candidate like
Ed willing to run, there was no reason for me to run. The $99,000 grant
for D-STAR equipment, alone, says a lot about his qualifications - - and
ability to 'get things done.' When a competent person serves as
Director, I do not have to run for the office, or be concerned about the
future of the ARRL. I can be satisfied that the person in this office
is a 'representative' not a 'commander.'

From: Jerry Karlovich, KD5OM
Topic: 1101 Message: 1101

Black Friday is the day after Thanksgiving. My son just showed me a web site that has ads for special Door-Buster sales. Look at this:
http://tinyurl.com/38w932
There will only be 15 per store. The store opens at 5am. Best Buy employees will be passing out tickets for items for those standing in line at 3am, (yawn!). But a PC for $199.97 with a 17 inch flat panel widescreen monitor, 1GB of ram and a 160gb hard drive? Shucks! The monitor alone is worth 200 bucks! Let's brew a pot of coffee and take turns standing in line.
Check out other ads at: http://bfads.net

Come, Come, Tom! Let's not snipe the HSMM y-group for pet candidate puffery.
I would humbly suggest you consider starting an ARRL Elections group for those
who wish to mix it up and duke it out on that topic.

IMHO, an ARRL election flame war is not really an HSMM topic and threatens to
consume way too much oxygen in this group.

Now please don't take this wrong but I must ask: when was the last time you posted
any HSMM related stuff on this group anyway? Inquiring minds want to know whehther
this is the beginning of a welcome and fruitful commitment to HSMM or just a base
move to hijack some of this group's bandwidth for other purposes.

From: TOM BLACKWELL
Topic: 1102 Message: 1103

Randy,

I joined this Yahoogroup in in 2004, on hearing presentations at club meetings and conventions about HSMM. I had some ideas of my own about the way a HSMM network should work, and wanted to discuss these with others. I also wanted to watch the progress that others were having. I've done that and I remain interested in it. I hope that answers your question.

Once every 3 years there is an ARRL election for Director and Vice Director. That's going on now. I prepared my comments about it, and made them available on ANOTHER Internet server. Another member of this HSMM Yahoogroup posted a link to that other server here. I didn't ask him to do this, and did not know he was going to post it here. I should not be surprised that someone would do that because of the importance of the election for people who share these interests. Then Walt DuBose posted a comment about me, and all of this, and I replied to it. I feel there are things that Walt does not understand. It seems he has received information about me from the wrong people. He posted something here on this HSMM Yahoogroup about me making plans to run for ARRL Director. If I had wanted to run for ARRL Director I would have filed the paperwork and my name would be on the ballot with the others. So I responded. I don't want people to believe things about me that are not correct, and I hope that ends the matter.

I think you will see continued ARRL support for HSMM, and maybe expanded support, if W5ETM and AK5Z are elected. I think Walt should go discuss this with his Section Manager in South Texas, Ray Taylor, N5NAV. Ray and I share the same opinions about this.

From: Randall Dunning
Topic: 1102 Message: 1104

Tom,

I thought I owed you an apology and went looking for any evidence that your claims below might be true. Using the YahooGroup search tool on the search string: "Blackwell" I found the following posts of yours with the first post being in Q4 of 2005

1. 31-Oct-2005 - Request for Ham Com facility diagram.
2. 17-Nov-2005 - Comment on New York Wireless LAN Law enforcement
3. 9-May-2006 - Called attention to an ad in QST
4. 13-Aug-2006 - Called for others to do work and write an article or book chapter.
5. 13-Nov-2007 - Defense of endorsement.
6. 14-Nov-2007 - Defense claiming HSMM activity

Strange, I found no postings sharing your thoughts with the group on how HSSM networks should work. I also could find no "ideas of your own" that the group could profit from as you claim in your 14 Nov defense. I guess I'll stand by my original post.

Regards,

RD

Randy,

The ideas I had about HSMM were discussed with various people privately at meetings and hamfests several years ago. I didn't post them here. So if you are looking for "evidence" you'll have to look further than the old messages that are archived on this Yahoogroup.

Sometimes ideas are just that and I wanted to see if anyone else was working in the same direction, to get a feel for where this stood technically and to see if what I wanted to suggest was practical.

It seems the commercial sector is well ahead of amateurs with these developments, as may be the case with the city's wireless laptop you carry around in Garland. I see that with some other technologies, too. Sometimes thinking about these things comes from 'outside the box.' While that never hurts anybody, I wanted to be in sync with others who have been involved for some time. So while I didn't post these things on this Yahoogroup they were discussed elsewhere.

As for Walt's comments, Ed Hare, the ARRL Laboratory Manager, advises me that the HSMM group is "no longer functioning." I think HSMM deserves this kind of support from the ARRL, and I'd like to see this change.

Tom, Randy,

Points well taken. Thank you both.

Let's get on with the focused HSMM experimentation that this fine reflector
was specifically designed for in the first place! It may be the only ACTIVE one remainingin
the world! Let's protect it dearly, even though our mother organization (ARRL) may not be
ready for it at this time.

However, there are strong signs of progress! The League is preparing to publish
a sister publication to the HF Digital handbook. It's called the VHF Digital Handbook,
and guess what? It has an entire section on HSMM! Do you think that would have
happened just a few short years ago, if not for the efforts of you all? No way, Jose!

You all demonstrated that Radio Amateurs could make a major contribution to the state
of the radio technology in HSMM radio. My heart felt congratulations!

But this struggle is the price we pay for being on the bleeding edge. Trust me, please!
Someday folks will look back on all of you as HSMM radio pioneers! Today we just need
to cooperate and move forward.

The ideas I had about HSMM were discussed with various people privately

at meetings and hamfests several years ago. I didn't post them here.

So if you are looking for "evidence" you'll have to look further than

the old messages that are archived on this Yahoogroup.

Sometimes ideas are just that and I wanted to see if anyone else was

working in the same direction, to get a feel for where this stood

technically and to see if what I wanted to suggest was practical.

It seems the commercial sector is well ahead of amateurs with these

developments, as may be the case with the city's wireless laptop you carry around in Garland. I see that with some other technologies, too. Sometimes thinking about these things comes from 'outside the box.' While that never hurts anybody, I wanted to be in sync with others who have been involved for some time. So while I didn't post these things on this Yahoogroup they were discussed elsewhere.

As for Walt's comments, Ed Hare, the ARRL Laboratory Manager, advises me that the HSMM group is "no longer functioning." I think HSMM deserves this kind of support from the ARRL, and I'd like to see this change.

1109. Streaming Video Solution

Yahoo group: DAWG-HSMM
Date: 2007-11-16 01:00:11 UTC
From: John Barrett
Topic: 1102 Message: 1109

I have been tasked with setting up a video feed from a tower mounted surveillance camera. Analog ATV has been ruled out, and I'm currently looking at a video capture card feeding a Windows Media Server system to provide streaming video to the consumer over WiFi.

My only problem is that Windows 2003 Server is a bit heavy for the P3/850+256m that I've got available. does anyone know of a lighter weight video server/viewer combination for windows that might make my life a little easier ?? Open Source/Freeware is a must for this one !

From MS, Windows Media Encoder is free. <
http://www.microsoft.com/windows/windowsmedia/forpros/encoder/default.mspx>

There are several packages from open source projects. The VLC client I use
appears to include a streaming capability. <http://www.videolan.org/>

It was my understanding that WME required WMS to deliver the stream to consumers.. the encoder alone isn't enough.. do you have details on setting up WME to stream directly to consumers ??

And to answer John Champa: I want to support multiple consumers.. Netmeeting would be single consumer only.

WMS is not required unless you plan to server many consumers or feeds. In that case, your limiting issue will be bandwidth. Then you may need to subscribe to a commercial streaming service for the bandwith.

WME default connections limit is 5, but can be set up to support up to 50 client connections. There is a registry change to set the limit. I believe I found that in the WME help file. Obviously it takes a bigger machine and network bandwidth to support more connections.

I had originally used WME to stream some scanner audio with a screen capture of the scanner software displaying frequency info. I also experimented with streaming video, but that takes a lot more bandwidth. Right now I'm using Icecast and some special scanner and SimpleCast ($) software to stream my scanner audio with frequency info tags. This has been fairly stable.

There is a wizard in WME to set up the configuration. Experiment with different settings to find what works best. As I said, if you plan to access over the Internet, bandwidth will be the limiting factor, then next maybe PC resources.

Another option is to use software that periodically captures an image from the video stream, and save it on a web server for viewing. I have an old cheap webcam that included software with that capability.

Good point, Randy. Even with highly compressed digital video ("TRASHED!", the ATVers would say....HI)
the codec is just like any other computer: Garbage in, garbage out. Of course there is a point of
diminished return, but using the cheapest webcam available might not be the best answer.

5 consumers would work just fine :-) I'm going to be using a Panasonic PTZ surveillance camera mounted on a tower, feeding a video capture card (hopefully with onboard compression), and feeding a WiFi local network only. there will not be an internet connection.. so I have the full 54mbit 802.11g connection to play with. The only limiting factor is CPU speed.. I'm using a Celeron 850 with 256mb ram, so I'm likely to run that resource out before I run out of net :-) I'm planning to compress as little as possible, and hoping to offload the compression on the capture card. I had at one time an Osprey 210, but it has gone missing and I'm trying to scrounge a suitable PCI capture card now. Might luck into a CPU and memory upgrade while I'm at it, but that's iffy as the motherboard docs say 256mb is the max - I'm going to try a 512k stick once I get hands on one, but I'm not holding out any hope. I'm also not sure that the board will take a Celeron III upgrade, though it is 100mhz FSB capable.

1121. SAVETHE DATE! 2008 Wild Ride Bike Rally

Yahoo group: DAWG-HSMM
Date: 2007-11-16 17:37:15 UTC
From: Douglas Kilgore
Topic: 1121 Message: 1121

SAVE THE DATE! The 5th Annual Wild Ride Bike Rally is scheduled for Saturday, May 17, 2008. I attended the Kick-Off meeting for next year's rally. The planning committee was very appreciative of all ham radio operators do in providing communications for the rally. They were very enthusiastic about the video display showing digital photos from the route in real time.

Money is the reason for holding the rally. All proceeds benefit the Richardson Regional Cancer Center. The Richardson Medical Center Foundation is a charitable 501(c)(3) organization. Right now the committee is looking for corporate sponsors for monetary or in-kind donations. It is important to contact businesses right NOW while they are in the budget planning process for next year.

If you can suggest a business which might be persuaded to join the Fight Against Cancer by including the Wild Ride Bike rally in their charitable community giving, please reply to me with the company name and information for contacting the appropriate person. I will pass on the info on to planning committee for action.

Thank you for your help in the past years and mark May 17, 2008 on your calendar for helping next year. The attached flyer has been prepared for pubicity purposes.

Building Wireless Community Networks

-- 2nd edition, by Rob Flickenger

This book is about getting people online using wireless network technology. The 802.11b standard (also known as WiFi) makes it possible to network towns, schools, neighborhoods, small business, and almost any kind of organization. All that's required is a willingness to cooperate and share resources. The first edition of this book helped thousands of people engage in community networking activities. This revised and expanded edition adds coverage on new network monitoring tools and techniques, regulations affecting wireless deployment, and IP network administration, including DNS and IP Tunneling.

182 pages. Second edition, © 2003, published by O'Reilly & Associates, Inc.
(ISBN: 0-596-00502-4) #9147 -- $29.95

802.11 Wireless Networks: The Definitive Guide
-- by Matthew S. Gast

Creating and administering wireless networks.

As we all know by now, wireless networks offer many advantages over fixed (or wired) networks. Foremost on that list is mobility, since going wireless frees you from the tether of an Ethernet cable at a desk. But that's just the tip of the cable-free iceberg. Wireless networks are also more flexible, faster and easier for you to use, and more affordable to deploy and maintain.

The de facto standard for wireless networking is the 802.11 protocol, which includes Wi-Fi (the wireless standard known as 802.11b) and its faster cousin, 802.11g. With easy-to-install 802.11 network hardware available everywhere you turn, the choice seems simple, and many people dive into wireless computing with less thought and planning than they'd give to a wired network. But it's wise to be familiar with both the capabilities and risks associated with the 802.11 protocols. And 802.11 Wireless Networks: The Definitive Guide, 2nd Edition is the perfect place to start.

This updated edition covers everything you'll ever need to know about wireless technology. Designed with the system administrator or serious home user in mind, it's a no-nonsense guide for setting up 802.11 on Windows and Linux. Among the wide range of topics covered are discussions on:
deployment considerations
network monitoring and performance tuning
wireless security issues
how to use and select access points
network monitoring essentials
wireless card configuration
security issues unique to wireless networks

With wireless technology, the advantages to its users are indeed plentiful. Companies no longer have to deal with the hassle and expense of wiring buildings, and households with several computers can avoid fights over who's online. And now, with 802.11 Wireless Networks: The Definitive Guide, 2nd Edition, you can integrate wireless technology into your current infrastructure with the utmost confidence.

Also available: Building Wireless Community Networks

Microwave Projects
-- Edited by Andy Barter, G8ATD
Aimed at those who are interested in building equipment for the Amateur Radio microwave bands. Packed full of ideas from around the world, this book covers the subject with a variety of projects. The book has many contributors who have a wealth of experience in this area and they have produced many projects, design ideas, complete designs and modifications of commercial equipment. This title provides much useful information as to what can be achieved effectively and economically. Covers useful theory of designing microwave circuits and test equipment for the projects. The book includes chapters covering:
Signal Sources
Transverters
Power Amplifiers
Test Equipment
Design
This is a must-have-book for all those who are already active on the microwave bands and those looking for interesting projects to embark on.
Also available: Microwave Projects 2
200 pages. © 2003, by Radio Society of Great Britain (RSGB)
(ISBN: 1-872309-90-9) #9022 -- $29.95

Microwave Projects 2
-- by Andy Barter, G8ATD
Following the huge success of Microwave Projects, this second volume brings you more innovative projects from around the world. If you are interested in building equipment for the Amateur Radio microwave bands, the designs in this book are sure to please you. Projects have been selected from international authors and all of the projects use modern techniques and current components. Details of how to obtain ready-made boards are included with most projects.
The book includes chapters covering:

Transverters and transmitters, including two new transverter designs for 23cm and 13cm plus an ATV transmitter for 3cm.
Receive amplifiers, including preamplifiers for 23cm, 13cm, 6cm and 3cm.
Power amplifiers, including a detailed design for a valve amplifier for 23cm plus solid state amplifiers for 23cm, 6cm, 3cm, 24GHz and 76GHz.
Filters, including detailed design technique for coaxial and stripline low pass filters.
Miscellaneous, including rare articles on using YIG oscillators and microwave absorbers.
If you are interested the microwave bands or Amateur Radio construction, Microwave Projects 2 provides great ideas and projects to satisfy everyone.
Also available: Microwave Projects
216 pages. © 2005, published by Radio Society of Great Britain (RSGB).

1126. Fort Worth Hamfest Bulletin to All Area Communications Organizations

Yahoo group: DAWG-HSMM
Date: 2007-12-11 17:11:47 UTC
From: David J
Topic: 1126 Message: 1126

This is a courtesy update to your organization from the Fort Worth Hamfest committee.

1) The Website for the Hamfest is located at http://www.fwhamfest.com

2) The date of the hamfest is Jan 11-12, 2008.

3) The location of the Hamfest is at the Lockheed-Martin Recreation Area (very nice and large indoor facility) in central Tarrant County.

4) Several slots for volunteer work shifts are available for free admission. Individuals interested in volunteering should sign up from the website.

5) Clubs and Organizations are offered a free information booth (no charge!) These are for nonsales. Only very few indoor tables are still available for sales. So far several organizations have signed up. Sign up using the feedback form on the website.

6) All Hamfest Attendees and their families, Presenters and Sellers are invited to attend a chili dinner social event at the Lockheed Martin Recreation Association Ranch House, 1/2 mile south of the Hamfest on Friday Night after the show closes (8pm). There will be no charge, however, voluntary contributions to defray the cost of the food will be welcome. For those who are able, please bring a pot luck contribution of side dish or dessert.

7) If your club wants to be represented on the steering committee, contact Robert Dickey ASAP via the feedback form on the website.

73, Happy Holidays

David Johnson KB5YLG
FW Hamfest Steering Committee

1128. ARRL VHF Digital Handbook - 2008

Yahoo group: DAWG-HSMM
Date: 2007-12-18 23:57:58 UTC
From: John Champa
Topic: 1127 Message: 1128

Doug,

Thanks for giving KB9MWR such a warm welcome. I have placed this list in the soon to be published ARRL VHF Digital Handbook as THE most active HSMM radio list in the world!

So we can probably expect more traffic....(HI)

73,
John, K8OCL

Welcome! Please feel free to ask questions on the group. We have very

knowledgeable individuals lurking on this list.

1129. Experimenting with Zipit???

Yahoo group: DAWG-HSMM
Date: 2007-12-19 07:07:39 UTC
From: Kilgore
Topic: 1129 Message: 1129

Is anyone on the group experimenting with the Zipit Wireless Messenger Z2? It's a handheld, Linux based Instant Messaging PDA device with 802.11g capabilities for $150 or less (ebay). Article says it will accept a 8Gb mini-SD card.

http://www.linuxdevices.com/news/NS5942157201.html

There's a Yahoo group about Zipit:

http://tech.groups.yahoo.com/group/zipitwireless/

1132. Balloon Launch Program at RWK

Yahoo group: DAWG-HSMM
Date: 2008-01-13 21:31:43 UTC
From: Kilgore
Topic: 1132 Message: 1132

Doug Loughmiller W5BL will be giving a presentation about the ARBONET-2 balloon launch at the Monday, Jan. 14, 2008 meeting of the Richardson Wireless Klub. RWK built a 10 meter CW beacon package that flew on the balloon.

The meeting will be held at 7:00pm at the St. Barnabas Presbyterian Church, 1222 West Beltline, Richardson - just east of Richardson High School.

Visitors are encouraged to come hear and see the results of this Nearspace adventure.

Asterisk - VoIP hosted on a Linux server. Can be
configured as a gateway for a single phone or as a
PBX. Can use conventional POTS phones and T1/E1
connections using the proper interfaces.

hope this helps.

From: Mars Reed
Topic: 1133 Message: 1135

Yes, Asterisk is indeed VoIP with the capability to handle telephone traffic from land line telephone (POTS), internet telephone (SIP, IAX2) and radio communications control and interconnect. Asterisk is "flexible interoperability" that can be used both in a commercial radio (i.e. industrial/business, public safety) as well as amateur radio systems. Currently have two Asterisk servers running (one for the shop the other for ALERTradio ERC) locally.

Plan to build several Asterisk servers into Communications Transportable Systems (CoTS) for field deployment. The CoTS would be where HSMM would come into the picture as this would provide a way to connect into the Public Switched Telephone Network (PSTN) and internet telephone to establish dial tone for event and incident communications. Asterisk provides a means in which mutliple systems / networks can be established separately as well as the ability to connect diverse systems / networks together as needed. One could have a Public Safety repeater attached as one node and a Amateur Radio Repeater on a second node yet both are controlled via the same server while both are separate functions. Another Amateur Radio repeater or link can be added to the server without any effect on the Public Safety of the server.

Currently there are three different ways to connect radio equipment to the Asterisk servers, the most recent method is a USB FOB (aka FROG : Full duplex Radio Operational Gear). The only limit to the capacity of a Asterisk server is the speed of the CPU and the amount of available memory.

1141. WiFi Rover for VHF SS

Yahoo group: DAWG-HSMM
Date: 2008-01-17 19:43:51 UTC
From: Rusty Haddock
Topic: 1141 Message: 1141

Chuck/AF8Z and Rusty/AE5AE will be available for contacts Saturday afternoon on 2.4 and 5.6 GHZ. Most of you have equipment for at least one of these bands in your computers... your WiFi Cards. We have been able to get data rates in excess of 14MBps at distances of over 1 mile.

Here's what to do:

The NetMeeting program is usually found on most Microsoft Windows XP computer systems, generally in the directory C:\Program Files\NetMeeting . The actual program file is named CONF.EXE.

Start NetMeeting by double clicking it. Under Options menu fill in some identifying information about yourself. Nothing too personal but a callsign in at least one of the name fields (first or last) would be great.

After NetMeeting has been setup, you'll need to find our Access Point.

On my Dell I right click on the signal bar icon down in the System Tray, then connect to the available SSID's. Our SSID's will be something like

CQ VHFSS 2GHZ AE5AE 10.4.59.73 for 802.11bg
and
CQ VHFSS 5GHZ AE5AE 10.4.59.73 for 802.11a

Once the connection to our access point has been made switch back to NetMeeting and make a "call" to 10.4.59.73 -- this is the IP address of *our* laptop. Once the call connects, open up a chat window by pressing the Chat button (looks like a cartoon dialog "bubble") and start typing.

We will give you our grid square and hopefully we will get yours.

Also, we may have voice and video capability so be prepared to see Rusty's smiling (albiet UUGLY) face. :-)

If you have both 802.11BG and 802.11A capability then switch bands so we can work you again.

We will be on Channel 1 for 802.11b/g (2412 MHz) and Channel 157 for 802.11a (5785 MHz). We are trying to avoid interfering with the weak signal portion of the band.

Planning liaison on 6M, 2 M, 70cm, and 23 cm.

We are accepting schedules at af8z@.... We don't have a lot of time since Sunday Chuck wants to contest from home.

hi, i am new to this and have an understading of setting up a wlan
and have one setup already, but when i start from scratch to set one
up like this i have problems,
when i do it ad-hoc it works with the two pc's when i put a router
in to it i have problems with the router (wrt-55ag)
could some one do a write up and put it in the files section of how
you have it set up???
i have the router setup the same way(with my call of course)
and connect to it but netmeeting has problem connecting
thanks

Did you turn off the firewall in your wireless router???
Have you tried other protocols, not just NetMeeting?
Can you ping each PC from the other?

FWIW, in our setup, our "roving" laptop was connected via
Ethernet cable to our AP.

no firewall on, thanks for you help thou i got it figured out
just had a case of "CRS" (can't remember you know)
"computer name"joe,james,big drive,ect... not network name got it:-)
i just make it harder than it really is, i did some road testing and
got about 1/4 mile with the factory antennas,i looked at the pictures
and it looks easy to change to a coax for outdoor antennas,
any recomondations for rovering???

You can probably get farther with the factory antennas. Alas, one thing
you do need to be able to tweak for SERIOUS distances (>1/4 or 1/2-mile)
is the ACKtimeout. Google "ack timeout" for a good description of this.
Nonetheless, the good ol' speed of light starts to become a limit for you
beyond the few hundred meters (~ 1/4-mile) for which 802.11 was designed.

I believe (maybe misguidedly) that few off-the-shelf AP's allow one
to tweak that parameter but take, say, an WRT54G with some third party
software... and you've got a chance. (OpenWRT and DD-WRT do, I beleive)
AND ACKtimeout really needs to be tweaked at BOTH ends of the long
distance wireless link!

Even at distances such as these, Chuck and I found that signal level is
not THAT much of a problem. **BUT** when it does become a problem simply
adding a better antenna does the job better, simpler, and cheaper than
amps & pre-amps. A multi-section vertical does a nice job but just about
anything for 2.4-GHz and 5.7-GHz (a beam or a dish) will work just peachy.

Last recommendation: find a high spot! :-)

Good luck!

thanks, that little bit of info was a big help,
i have tried recive amps on some other things and it seems
to just bring up the noise figure in less it is tuned,
a properly tuned antenna makes a world of difference
bandpass filter help on some things also,73's

Welcome -

Please ask any questions you have. There are a number of very knowledgeable persons on this group.

In Richardson,. TX were are in planning stages for providing the 64 mile 2008 Wild Ride Bike Rally with internet connection. Last year we had 4 reststops connected to the internet with 802.11 and D-star. Digital pictures were uploaded to the web server. An internet feed from a City of Richardson building put the internet at the Start/Finish line. Operators in Net Control could see what was happening. In addition, we had a large screen TV in the hospitality area alternately displaying sponsor logos and the digital pictures from the route. The ride committee really liked that. This year we are going to try for 2 displays.

Let us hear what is happening in Boise.

1150. ARRL/TAPR Digital Communications Conference in Chicago Dates Announced

Yahoo group: DAWG-HSMM
Date: 2008-02-05 17:25:06 UTC
From: Mark Thompson
Topic: 1150 Message: 1150

Dates for ARRL/TAPR Digital Communications Conference in Chicago Announced (Feb 4, 2008) --

The Tucson Amateur Packet Radio Corporation (TAPR) has announced that the 2008 ARRL/TAPR Digital Communications Conference will take place September 26-28 at the Holiday Inn Hotel in Elk Grove Village, Illinois, a suburb of Chicago, near O'Hare airport.

The conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results and practical applications. Forums will feature the latest developments in Amateur Radio digital communications, as well as demonstrations of emerging digital technology.

More information is available on the ARRL/TAPR DCC Web site, http://www.tapr.org/dcc.html

1151. Call for Papers - ARRL and TAPR Digital Communications Conference

Yahoo group: DAWG-HSMM
Date: 2008-02-06 04:39:20 UTC
From: Mark Thompson
Topic: 1151 Message: 1151

Conferences:
ARRL and TAPR Digital Communications Conference
The 27th DCC
September 26-28, 2008 - Chicago , Illinois

Introduction
Mark your calendar and start making plans to attend the premier technical conference of the year, the 27th Annual ARRL and TAPR Digital Communications Conference to be held September 26-28, 2008, in Chicago , Illinois. The conference location is the Holiday Inn Hotel, Elk Grove Village IL
The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work, and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications.

Topics include, but are not limited to: Software defined radio (SDR), digital voice, digital satellite communications, Global Position System (GPS), precision timing, Automatic Position Reporting System® (APRS), short messaging (a mode of APRS), Digital Signal Processing (DSP), HF digital modes, Internet interoperability with amateur radio networks, spread spectrum, IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio, using TCP/IP networking over amateur radio, mesh and peer to peer wireless networking, emergency and Homeland Defense backup digital communications, using Linux in amateur radio, updates on AX.25 and other wireless networking protocols.

Call for Papers
Technical papers are solicited for presentation at the 27th Annual ARRL and TAPR Digital Communications Conference to be held September 26-28, 2008 in Chicago , Illinois and publication in the Conference Proceedings. Annual conference proceedings are published by the ARRL. Presentation at the conference is not required for publication. Submission of papers are due by July 31st, 2008 and should be submitted to
Maty Weinberg, ARRL
225 Main Street
Newington , CT 06111
or via the Internet to maty@...

Details on Call for Papers
Technical papers are solicited for presentation at the ARRL and TAPR Digital Communications Conference for publication in the Conference Proceedings.
Annual conference proceedings are published by the ARRL. Presentation at the conference is not required for publication.

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work, and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. Topics include, but are not limited to:

Software defined radio (SDR)
Digital voice
Digital satellite communications
Global position system
Precise Timing
Automatic Position Reporting System (APRS)
Short messaging (a mode of APRS)
Digital Signal Processing (DSP)
HF digital modes
Internet interoperability with Amateur Radio networks
Spread spectrum
IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio
Using TCP/IP networking over Amateur Radio
Mesh and peer to peer wireless networking
Emergency and Homeland Defense backup digital communications in Amateur Radio
Updates on AX.25 and other wireless networking protocols
Topics that advanced the amateur radio art

Submission Guide Lines
Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. If you know of someone who is doing great things with digital communications, be sure to personally tell them about this!

See above for deadlines and where to submit your paper.

Some quick guidelines:
Papers should be on 8-1/2 X 11 inch paper with the following margins: left and right, 0.75 inch; top, 0.8 inch; and bottom, 1 inch (very important).
Structure of paper should be (see single column example below, two column should follow a similar format):
Title
Author(s) with affiliation
Abstract (200 words or less)
Key words (3-5)
Body
Reference List
Papers can be in one- or two-column format.
Use 12-point Times Roman for the main body of text; do not number pages.
Photos and drawings should have good contrast. Note: a photocopy gives a good indication of print quality.
Electronic submissions can be made in any of the following formats:
Adobe Acrobat PDF;
Microsoft Word
Reference citations and other topics not explicitly discussed in this list should follow a recognized standard format (APA, IEEE, etc).
A biographical page is to be included with the manuscript. It should contain Name, Address, Phone, and E-mail for each author as well as a short descriptive paragraph about the first author. The bio page will be used to contact authors concerning the conference and presentation schedule.
Release form:

A formal release form is not required, but indicate that the paper is being sent for use in the Proceedings of the ARRL and TAPR Digital Communications Conference. You are only giving permission for your paper to be printed in the Proceedings.

Example Single Column Page Layout
Two column would be similar in nature, but with two columns.
View Paper Example http://www.tapr.org/images/dcc.paper.large.gif

1153. Verizon Vios vs Time Warner Cable?

Yahoo group: DAWG-HSMM
Date: 2008-02-06 21:00:42 UTC
From: Jerry Karlovich, KD5OM
Topic: 1153 Message: 1153

We're considering switching to Vios. We currently have TW high speed internet and digital TV. Verizon also wants to put our phone line on Vios. The price difference is tempting. However, I have serious issues with most anything having to do with Verizon due to past dealings :(. I don't like being lied to. Is this another smooth talking salesman or is the service acceptable?

From what I've read, if you go with FIOS, they can/will pull your copper phone lines which will lock you in to verizon only in the future... HOWEVER you are supposed to be able to specify that they not disrupt your copper lines at the demarcation box.

Again, this is just what I've read from slashdot.

Jerry,

I think you mean FiOS which is their fiber to the home service. Everyone I know that has it is very pleased with the quality and service level. The only thing that is a concern is the ONU (Optical Network Unit) that converts from fiber to copper in the house has a battery backup. if your power is out for a very long time, then the battery can run down. Other than that, it is a good reliable product from what I hear.

Remember, I work for 'the other phone guys', but we don't compete in your area for that type of service.

Regards,
Keith KE0FV

Hey Keith,

Tnx for the reply.

I feel silly now. I know it's FiOS and not VIOS. Do you think I can have them do an installation at a patch panel in my Garage? I will buy the cables to homerun everything to that point. The cable guys in the past have my attic looking like a real mess with coax running back and forth and splitters and amplifiers everywhere. Can you say TVI? Besides, TW is no longer on the dual coax system. We have TVs at 6 locations and a wireless router. Does very set need a STB?

I am not 100% familiar with their product, but I believe every TV set needs a STB. I think they run Cat-5 to all of the boxes, so if it ia slready run to a single point in the garage, then they should be able to put the ONU there.

Others on here who have the service can probably tell you better than I can.

The ONI (Optical Network Interface) box on the side of your house terminates the fiber connection and breaks it out into a limited amount of CATV video (about 20 channels in my case), digital video over coax for delivery to each STB, a 100Mbps full-duplex Ethernet port, and two POTS lines.

Based on what services you buy from them determines what cables they run into your house. In my case, CATV and Ethernet into the house that terminate into a router that provides standard Internet connectivity to my home network. The box also provides Internet connectivity to the STBs for the guide service and Video-on-demand.

As was said earlier, my only issue is that the ONI is backed up by a small UPS unit which would only last for a few hours of a power grid outage. Additionally, the battery backup only provides power to the POTS lines as far as I can tell. I know my Internet has disappeared during a power outage, haven't had a chance to test video service during a power outage.

The battery is to power the entire ONI as you cannot
drive DC voltage down fiber.

As far as where the unit gets mounted, Verizon will
typically demarc the box outside your premises so that
they have access to the ONI. In my neighborhood, it
has been installed in the same area as the old POTS
demarc block.

Hi guys. My FIOS box ran for just over 4 hours with the power out at the house last year. That was until the RED warning light on the Battery backup unit came on. Since there was no power at the house I could not test Internet and TV since there was no power for the Router and Network gear or the TV and STB.

The CATV signal has about 20-30 channels of Analog TV the rest are QAM digital with encryption so a STB is needed. I would expect to see the analog channels go away next year when over the air analog goes away. Since I have an older Optical box it does not so the IP over CATV function and I have an additional box that puts IP Packets on the cable for the STB so its Guide and Video on Demand works. Over all I am happy with the service and selection thats available.

Ron
n5hyh

"Pat \"BUFF\" Hykkonen" <pat@...> wrote: The ONI (Optical Network Interface) box on the side of your house
terminates the fiber connection and breaks it out into a limited
amount of CATV video (about 20 channels in my case), digital video
over coax for delivery to each STB, a 100Mbps full-duplex Ethernet
port, and two POTS lines.

Based on what services you buy from them determines what cables they
run into your house. In my case, CATV and Ethernet into the house
that terminate into a router that provides standard Internet
connectivity to my home network. The box also provides Internet
connectivity to the STBs for the guide service and Video-on-demand.

As was said earlier, my only issue is that the ONI is backed up by a
small UPS unit which would only last for a few hours of a power grid
outage. Additionally, the battery backup only provides power to the
POTS lines as far as I can tell. I know my Internet has disappeared
during a power outage, haven't had a chance to test video service
during a power outage.

Jerry,

You can do that! No problem!

Each set needs an STB unless you have one of those digital ready TVs with the right credentials.

I would check with them as there may be limitations.

Frankly, their STB and controller work fine in each room of my home, so no complaints here!

Thanks & 73,

Gordon Beattie, W2TTT

Keith,

Funny finding you here!

FIOS works quite well here for data, voice and video.

I have FIOS that is fed by fiber then coax to a splitter that feeds my TV splitter and my router.

Everything from Verizon is in my ham shack. The fiber comes in the third floor wall from the pole on the street into my access panel and right to their ONU bolted to the wall.

Next to it is a shelf with their router and coaxes everywhere! I need to dress that up better. They did what I asked and left me slack as I'm still getting things arranged in here!

One of my friends has a standby power unit that you can buy for your computer. He found a decent sized one that powers everything including the router for a few days and all he did was plug Verizon's gear into it. I may do that, but I also have a 12V backup supply that I may use instead for the router as it wants 12V. The nature of the ONU supply has not been investigated yet!

We'll see!

Thanks!

I made the switch. It was a nightmare switching the phone from Time Warner to Verizon. I will never deal with Time Warner again.

The FiOS has been fine for the TV. We had one problem which turned out to be a loose coax connection on the box outside.

I am not crazy about their digital recorder, I like the TiVo better. But we are living with it. Every TV needs one of their boxes or the Digital Video Recorder. I do not know about the new TVs.

The Internet is offered at two speeds. 5MB down and 15MB down (both have 200K up). I went with the $10 cheaper 5MB down and it seems faster than the advertised "6 MB down" of Time Warner. My Speed tests show I am getting close to 5 MB down. I never got that fast with the cable.

The gave us a wireless router, that plugs into the coax and has 4 Ethernet ports. They gave me the password for the box so I can modify the settings. I did not see anything I wanted to modify, but it is nice to have the ability. I placed it on top of the Entertainment Center so it was high and it reaches all over the house.

I have 6 computes hooked up wired, and my laptop and PDA's talk to the wireless no problem once you put in the codes. I don't think I can use 15 MB down, as many websites have their speed limited per user.

The voice mail still does not work after about a year, so we have given up fighting with them.

We have not lost service yet.

We have had FiOS for over a year. Observations:

o FiOS service is better than cable with noticably less down time.

o The Verizon supplied FiOS router (wireless and 4 port wired Ethernet switch) has a weakling 802.11 over the air interface on some units and the wall wart has a life expectancy of about 9 months. I turned off the gimpy wireless interface and route internet from my Verizon supplied router to my trusty Linksys WRT-54G and all is well.

o The battery backup in the FiOS wall unit will probably outlast your computer UPS battery backup. Your flat panel TV will be down for the duration of the outage and the FiOS TV interface box will also be dead. Only laptop users might notice during a power failure since they go several hours if fully charged.

o Your POTS telephone may not work after the battery backup fails if you use FiOS for your phone land line. (I haven't tested this)

o Overall, I like FiOS and really enjoy the 5 mbps download speed.

RD,

I guess in Texas the bandwidth is less than here in New Jersey.

We have 20 down and 5 up service here and I can get 20/20 and higher rates if I want to pay for it.

The shack TV will be battery backed up as will the STB here.

The laptops have access to 12V sources as well.

My big LCD TV will only run if the generator is honking away! J

One question: Where does one get a replacement or spare router with the coaxial interface?

Rather than cascade routers to get an improved wireless access, it might be nice to find an improved product.

Andy ideas?

Thanks!

Granted, a better router from Verizon would be nice but there was none in view the last
time I looked. Cascading routers works and took advantage of existing assets on hand
as is the amateur way! [There has been much discussion of the virtues of the Linux
based WRT-54G in other HSMM threads so I won't go into additional detail here.]

You can get much higher theoretical rates with FiOS than copper with the planned roll out
of higher rate options coming (according to the FiOS managers I have talked with). As it
stands you can get 15 for a few shekels more. One nice benefit of fiber to the home
is you get reduced risk of line-to-ground power surge input from lightening strikes in the
neighborhood as electricity is far less likely to follow the fiber than the copper.

Now I was talking merely worst case as far as the power situation goes. As for me and
my house, I'd just plug in the 4KW solar/wind powered trailer to the 10 most critical circuits
in the house and continue operating, only using the 10KW tri-fuel generator when extra juice is
is required to keep the batteries in tip top condition. The 360 AmpHrs at 24v battery bank
stands ready and willing to do the heavy lifting. Calculating fuel on hand and the average
wind and solar resources available I should be able to withstand a 15 to 20 day power outage
keeping warm & dry while also keeping the lights, refrigerator, freezer, and the FiOS box
running.

Cheers,

RD - KC5QHH

I cascade my router with DHCP turned off behind the Verizon router by tying user ports together.

Someone has asked me to test something using the second uplink tied to a Verizon router user port, but I can't get it to route.

Has anyone gotten this to work?

Do I need to turn on DHCP back on in the downstream router and allocate addresses differently?

Thanks!
Gordon

I was not happy with the Verizon provided dLink router. I found it to be unstable with weekly lockups and was very slow with dns forwarding.

I switched to a Netgear router and I the network response time was vastley improved. On top of that I got a VPN capable router which has come in handy a couple of times when I needed to get at files on the home pc from the internet.

Hi,
My project is for Digital Communications and Communications Electronics class. The idea at the beginning was WIMAX, and being a radio amateur I knew there had to be something like WIMAX on HAM frecs. The first step is working with my teammates to do a basic peer to peer communication using HSMM on 5GHz. After this is presented and semester is over I was thinking to keep working on it and move it to 2.4GHz where most commercial wifi cards are and see if COFETEL (Mexican FCC) allows us to put a small LAN (For what I could see 3 to 5 km if more better) which would be connected to one of the University's server. The server should had educational information for children, youngsters and adults like health issues. Opened to any one within coverage to inform themselves.
So there you go it is divided into 2 projects, the one mandatory for classes and the other as the University Radio Club.
The final really big project seems a nice way in which students being HAM or not could help their community, it is really complicated as I have seen but I think is worth it.

-Andres

From: John Barrett
Topic: 1166 Message: 1173

You have the option of setting your Verizon router to bridge mode, and setting your better router to to DHCP. eliminates the double NAT and gives you a single point of control for DMZ, Port Forwarding, etc. I'm doing that with the telco DSL router and my linksys.. makes life a lot easier :-)

To: ntms-hsmm@yahoogroups.com
Subject: [ntms-hsmm] Re: Verizon FiOS vs Time Warner Cable

Granted, a better router from Verizon would be nice but there was none in view the last
time I looked. Cascading routers works and took advantage of existing assets on hand
as is the amateur way! [There has been much discussion of the virtues of the Linux
based WRT-54G in other HSMM threads so I won't go into additional detail here.]

You can get much higher theoretical rates with FiOS than copper with the planned roll out
of higher rate options coming (according to the FiOS managers I have talked with). As it
stands you can get 15 for a few shekels more. One nice benefit of fiber to the home
is you get reduced risk of line-to-ground power surge input from lightening strikes in the
neighborhood as electricity is far less likely to follow the fiber than the copper.

Now I was talking merely worst case as far as the power situation goes. As for me and
my house, I'd just plug in the 4KW solar/wind powered trailer to the 10 most critical circuits
in the house and continue operating, only using the 10KW tri-fuel generator when extra juice is
is required to keep the batteries in tip top condition. The 360 AmpHrs at 24v battery bank
stands ready and willing to do the heavy lifting. Calculating fuel on hand and the average
wind and solar resources available I should be able to withstand a 15 to 20 day power outage
keeping warm & dry while also keeping the lights, refrigerator, freezer,

and the FiOS box
running.

Cheers,

RD - KC5QHH

Just dump the Verizon Router any decent router supports PPOE on the WAN port.

Second uplink ?? like dual FIOS connections ?? You need a Linux box with multiple network cards, or some very fancy hacking on a WRT54 to enable network uplink balancing. people used to pull that trick with multiple modem connections.. searching for info about balanced modem connections might help you figure out how to make it happen on the WRT54

There should ONE and ONLY ONE DHCP server for any given network segment (unless you are all static IP on that segment - then no DHCP is ok)

I think I need a better picture of what you are trying to accomplish to work out a solution :-)

I cascade my router with DHCP turned off behind the Verizon router by tying user ports together.

Someone has asked me to test something using the second uplink tied to a Verizon router user port, but I can't get it to route.

Has anyone gotten this to work?

Do I need to turn on DHCP back on in the downstream router and allocate addresses differently?

Thanks!
Gordon

1177. Verizon Fios Routers & Set Top Boxes

Yahoo group: DAWG-HSMM
Date: 2008-02-09 15:30:21 UTC
From: Allan R. Batteiger
Topic: 1177 Message: 1177

Greetings
I thought I would add my 2 cents to the discussion about Verizion FIOS. I have the standard 15/2 connection here. Since I was an early only to hook up my setup is a little different. My ONT has 4 POTS ports on it vs 2 ports on the newer versions. Also my internet connection used a MoCA to Ethernet adapter to attach to the router. You can replace the inexpensive D-Link router with a much better router and still hook up you STB's to the internet (for the guide and VOD) if you can get from Verizion or elsewhere a MoCA to Ethernet adapter. MoCA is the IP protocol over coax used by the set top boxes. I currently have a Business class Linksys / Cisco router & firewall hooked up to the FIOS internet connection. I consistently get over 10mb connections to local servers. The MoCA adapter is connected to one of the Firewall ports and is configured to route to the WAN vs the rest of the LAN.

Sorry folks. I don't often do cross-postings, but this one is worth it:

Not really meant to be forwarded, but I badly wanted to point out Item #4 in Tony's list because it relates to previous discussions here in the digital realm...The Aussies have added the allowance of ENCRYPTION directly to their Amateur Radio regulations for VERY SANE PURPOSES... FINALLY!Now if we could just get the FCC to follow suit...Nate WY0X-------- Original Message --------Subject: [irlp] Changes to Australian regulations, some of which affect IRLP and EcholinkDate: Fri, 08 Feb 2008 13:07:05 +1100From: Tony Langdon, VK3JED <vk3jed@...>Reply-To: irlp@yahoogroups.comTo: irlp@yahoogroups.com, echolink@yahoogroups.comJust announced by the ACMA are changes to the Australian AmateurLCD. Several of these changes are relevant to the IRLP and Echolinkcommunity. The full news releases are on the WIA website(www.wia.org.au), but I'll try and post a summary of myinterpretations that appear to be particularly relevant.Note that the Internet is considered a "public telecommunicationsnetwork", along with PSTN.1. Advanced, Standard and Repeater stations may operateautomatically when connected to a public telecommunications network,provided the licensee has implemented reasonable measures to ensurethat only appropriately licensed persons access the station totransmit signals to another amateur station. Both IRLP and Echolinkimplement what are deemed "reasonable measures". Also, this appearsto allow phone patches under certain conditions - The WIAinterpretation is this is to bring the rules in line with accepted practice.2. Advanced and Standard (but not repeater) licensees must warnpersons connecting from a public telecommunications network thattheir conversation may be lawfully intercepted by other persons (i.e.amateurs and SWLs listening on RF), and advise them to disconnect ifthey do not wish to proceed under those conditions. While this mightseem strange, this is a result of our Telecommunications Act,combined with the new regulations allowing unqualified people (i.e.non hams) to speak via a station controlled by a licensedham. Obviously, Echolink PC users know they can be monitored by SWLsif there is an RF link... Repeaters were exempted on the grounds ofpracticality.3. Australian stations may transmit third party messages to amateursin other countries, though the amateur in the other country may stillbe bound by their regulations and may not be permitted to exchangesuch messages.4. Transmissions may be encoded to obscure the meaning of signals(i.e. encrypted) under the following conditions ONLY:- Command and control of an amateur space station- Command and control of an unattended amateur station- emergency communications and related training exercises.Looks like I can now implement SSH over packet for control of theIRLP node and repeater...Another important change is that Foundation licensees can NOT connecttheir station directly to a telecommunications network. This meansthey can NOT operate an Echolink -L station or an IRLP nodethemselves. I know there are a number of "F" calls operatingEcholink links. Unfortunately, they will have to either switch offor upgrade to at least Standard, but this change is perfectlyreasonable, given the scope of a Foundation license. Similarly,Foundation licensees cannot operate (i.e. be the trustee of) arepeater station. Of course, they can still use repeaters.However, as before, Foundation licensees can _use_ an IRLP orEcholink node, provided it's on a frequency they're allowed to use,and they can access Echolink from their PC.What I am not quite sure on yet is whether nodes operating on bandsoutside Foundation allocations can be legally used by them via IRLPor Echolink (i.e. they access them from a PC or a node on a band theycan use). At this stage, my guess is

"maybe". This means I _may_ beable to put 23cm on the air and run IRLP or Echolink on the system (away to utilise a way underutilised band).Other points of interest:We now have specs on spurious emission limits (finally!)We now have a Class Licence for visiting amateurs (effective Feb 142008). This permit allows overseas amateurs to operate in Australiafor up to 90 days using their home call "portable VKn"(homecall/VKn). There are 5 levels of visitor license, and detailswill be posted on the ACMA website in the near future. No morehaving to obtain a VK ticket before visiting. :)Anyway, as I said at the top, visit www.wia.org.au and check out thenews releases for more information.73 de VK3JEDhttp://vkradio.com

-------- Original Message --------
Subject: [irlp] Changes to Australian regulations, some of which affect
IRLP and Echolink
Date: Fri, 08 Feb 2008 13:07:05 +1100
From: Tony Langdon, VK3JED <vk3jed@...>
Reply-To: irlp@yahoogroups.com
To: irlp@yahoogroups.com, echolink@yahoogroups.com

Just announced by the ACMA are changes to the Australian Amateur
LCD. Several of these changes are relevant to the IRLP and Echolink
community. The full news releases are on the WIA website
(www.wia.org.au), but I'll try and post a summary of my
interpretations that appear to be particularly relevant.

Note that the Internet is considered a "public telecommunications
network", along with PSTN.

1. Advanced, Standard and Repeater stations may operate automatically when connected to a public telecommunications network, provided the licensee has implemented reasonable measures to ensure that only appropriately licensed persons access the station to transmit signals to another amateur station. Both IRLP and Echolink implement what are deemed "reasonable measures". Also, this appears to allow phone patches under certain conditions - The WIA interpretation is this is to bring the rules in line with accepted practice.

2. Advanced and Standard (but not repeater) licensees must warn persons connecting from a public telecommunications network that their conversation may be lawfully intercepted by other persons (i.e. amateurs and SWLs listening on RF), and advise them to disconnect if they do not wish to proceed under those conditions. While this might seem strange, this is a result of our Telecommunications Act, combined with the new regulations allowing unqualified people (i.e. non hams) to speak via a station controlled by a licensed ham. Obviously, Echolink PC users know they can be monitored by SWLs if there is an RF link... Repeaters were exempted on the grounds of practicality.

3. Australian stations may transmit third party messages to amateurs in other countries, though the amateur in the other country may still be bound by their regulations and may not be permitted to exchange such messages.

4. Transmissions may be encoded to obscure the meaning of signals (i.e. encrypted) under the following conditions ONLY:
- Command and control of an amateur space station
- Command and control of an unattended amateur station
- emergency communications and related training exercises.

Looks like I can now implement SSH over packet for control of the IRLP node and repeater...

Another important change is that Foundation licensees can NOT connect their station directly to a telecommunications network. This means they can NOT operate an Echolink -L station or an IRLP node themselves. I know there are a number of "F" calls operating Echolink links. Unfortunately, they will have to either switch off or upgrade to at least Standard, but this change is perfectly reasonable, given the scope of a Foundation license. Similarly, Foundation licensees cannot operate (i.e. be the trustee of) a repeater station. Of course, they can still use repeaters.

However, as before, Foundation licensees can _use_ an IRLP or Echolink node, provided it's on a frequency they're allowed to use, and they can access Echolink from their PC.

What I am not quite sure on yet is whether nodes operating on bands outside Foundation allocations can be legally used by them via IRLP or Echolink (i.e. they access them from a PC or a node on a band they

can use). At this stage, my guess is "maybe". This means I _may_ be able to put 23cm on the air and run IRLP or Echolink on the system (a way to utilise a way underutilised band).

Other points of interest:

We now have specs on spurious emission limits (finally!)

We now have a Class Licence for visiting amateurs (effective Feb 14 2008). This permit allows overseas amateurs to operate in Australia for up to 90 days using their home call "portable VKn" (homecall/VKn). There are 5 levels of visitor license, and details will be posted on the ACMA website in the near future. No more having to obtain a VK ticket before visiting. :)

Anyway, as I said at the top, visit www.wia.org.au and check out the news releases for more information.

Randy, According to the interpretation the HSMM WG got from the FCC Enforcement Branchvia Chris Imlay just prior to our closing shop was that Radio Amateurs using 802.11-typemodulation under Part 97 could use WEP, WPA, etc. as our intent or purpose (key operative words!) is to provide authentication and thus protect our networks from Part 15 intrusions...and not to obsure the meaning of the signals. Under the following conditions: (1) Use only frequencies above 50 MHz.(2) No foreign / international traffic is permitted(3) The type of encryption used must be standardized and published(4) The specific encryption key used must be recorded in the station log book These guidelines will be provided in somewhat more detail in the soon to be release (March 1st) ARRL VHF Digital Handbook, Chapter 7, HSMM Radio. 73,John, K8OCL

To: k8ocl@...: ntms-hsmm@yahoogroups.com; radioskyart@...: Re: EncryptionFrom: rddunnin@...: Tue, 12 Feb 2008 10:51:10 -0600Transmissions may be encoded to obscure the meaning of signals(i.e. encrypted) under the following conditions ONLY:- Command and control of an amateur space station- Command and control of an unattended amateur station- emergency communications and related training exercises. Excellent. We need to get a petition before the FCC on this.

Encryption

Sorry folks. I don't often do cross-postings, but this one is worth it:Not really meant to be forwarded, but I badly wanted to point out Item #4 in Tony's list because it relates to previous discussions here in the digital realm...The Aussies have added the allowance of ENCRYPTION directly to their Amateur Radio regulations for VERY SANE PURPOSES... FINALLY!Now if we could just get the FCC to follow suit...Nate WY0X-------- Original Message --------Subject: [irlp] Changes to Australian regulations, some of which affect IRLP and EcholinkDate: Fri, 08 Feb 2008 13:07:05 +1100From: Tony Langdon, VK3JED <vk3jed@...>Reply-To: irlp@yahoogroups.comTo: irlp@yahoogroups.com, echolink@yahoogroups.comJust announced by the ACMA are changes to the Australian AmateurLCD. Several of these changes are relevant to the IRLP and Echolinkcommunity. The full news releases are on the WIA website(www.wia.org.au), but I'll try and post a summary of myinterpretations that appear to be particularly relevant.Note that the Internet is considered a "public telecommunicationsnetwork", along with PSTN.1. Advanced, Standard and Repeater stations may operateautomatically when connected to a public telecommunications network,provided the licensee has implemented reasonable measures to ensurethat only appropriately licensed persons access the station totransmit signals to another amateur station. Both IRLP and Echolinkimplement what are deemed "reasonable measures". Also, this

appearsto allow phone patches under certain conditions - The WIAinterpretation is this is to bring the rules in line with accepted practice.2. Advanced and Standard (but not repeater) licensees must warnpersons connecting from a public telecommunications network thattheir conversation may be lawfully intercepted by other persons (i.e.amateurs and SWLs listening on RF), and advise them to disconnect ifthey do not wish to proceed under those conditions. While this mightseem strange, this is a result of our Telecommunications Act,combined with the new regulations allowing unqualified people (i.e.non hams) to speak via a station controlled by a licensedham. Obviously, Echolink PC users know they can be monitored by SWLsif there is an RF link... Repeaters were exempted on the grounds ofpracticality.3. Australian stations may transmit third party messages to amateursin other countries, though the amateur in the other country may stillbe bound by their regulations and may not be permitted to exchangesuch messages.4. Transmissions may be encoded to obscure the meaning of signals(i.e. encrypted) under the following conditions ONLY:- Command and control of an amateur space station- Command and control of an unattended amateur station- emergency communications and related training exercises.Looks like I can now implement SSH over packet for control of theIRLP node and repeater...Another important change is that Foundation licensees can NOT connecttheir station directly to a telecommunications network. This meansthey can NOT operate an Echolink -L station or an IRLP nodethemselves. I know there are a number of "F" calls operatingEcholink links. Unfortunately, they will have to either switch offor upgrade to at least Standard, but this change is perfectlyreasonable, given the scope of a Foundation license. Similarly,Foundation licensees cannot operate (i.e. be the trustee of) arepeater station. Of course, they can still use repeaters.However, as before, Foundation licensees can _use_ an IRLP orEcholink node, provided it's on a frequency they're allowed to use,and they can access Echolink from their PC.What I am not quite sure on yet is whether nodes operating on bandsoutside Foundation allocations can be legally used by them via IRLPor Echolink (i.e. they access them from a PC or a node on a band theycan use). At this stage, my guess is "maybe". This means I _may_ beable to put 23cm on the air and run IRLP or Echolink on the system (away to utilise a way underutilised band).Other points of interest:We now have specs on spurious emission limits (finally!)We now have a Class Licence for visiting amateurs (effective Feb 142008). This permit allows overseas amateurs to operate in Australiafor up to 90 days using their home call "portable VKn"(homecall/VKn). There are 5 levels of visitor license, and detailswill be posted on the ACMA website in the near future. No morehaving to obtain a VK ticket before visiting. :)Anyway, as I said at the top, visit www.wia.org.au and check out thenews releases for more information.73 de VK3JEDhttp://vkradio.com

Two other comments and I was also in on the session where the HSMM WG was advised of the FCC explanation.

As a retired government employee who worked extensively with government agencies, the two key words are "intent" and "Foreign countries" (nations.

If you read Part 97, the word "intent" is in there...clearly the FCC did not and does not think that the normal use of encryption is to obscure the meaning of the text...they DO trust us to monitor and to the extent possible "police" and "regualte" our individual and corporate operation.

The other word.."foreign traffic is present and we should already understand that we cannot put out a traffic/message/text to for some other nation that might cause their amateur radio operator to violate that countries communications regulation.

Their reference to 50 MHz and above I believe is aimed at the above paragraph since 50 MHz and above are not generally used for foreign communications exchanges.

AS a retired government employee, I think that the verbal word from the FCC was magnanimous considering the consequences of the FCC providing a written opinion.

"Transmissions may be encoded to obscure the meaning of signals"

Actually, you could say that the tightwads at the FCC already are ahead of the Ozzies on this one. IIRC a statute normally will held held by the courts to the strict wording of the statute. And since the FCC foolishly said "to obscure the meaning" that means we already ARE ALLOWED encryption for any and all other purposes. Whether this was the FCC's intent or not.

Now, it could be a bit of hassle defending that point of view <G> but the FCC has also gone on record as saying that encryption is allowed if the keys are sent to the FCC or otherwise "published". You could email them to the NSA and fulfill that requirement, since the NSA already is legally required to monitor everything in the ethereal realm.

It sure would be nice if the FCC bothered to hire Ynglish majors and follow the "plain english" laws, but as long as they've been so kind as to leave the barn doors open...I wouldn't worry too much about it. Just make Real Damn Sure that before you key down, you send the NSA a list of encryption keys and/or you log your reason for encryption, as it is something other than "obscuring". For instance: *securing* from criminal eavesdroppers, during a mass casualty/evacuation response. Or *protecting* a national security interest. Or...surely, there must be others reasons, because if the sole purpose of "encyrpting" was "obscuring", it would have been redundant of the FCC to use both terms in the same sentence. And that would be held against them.

From: John Champa
Topic: 1178 Message: 1185

Don't send keys to anybody, at least not routinely. And, don't publish them either, unless you want to, or it is club policy etc. For example, some clubs treat their HSMM network WEP key for Field Day, etc. much as other clubs treat their repeater's PL tone. That is their choice, but it is no longer a requirement.

All that is currently required is to have the key available if questioned by an OO, etc. regarding traffic content, etc. Here's the background:

The FCC direction changed. Initially the keys had to be published.
But for the keys to be meaningful for the intent of protecting the network, they can not be published. That would be somewhat disingenuous to publish the key. Rather like putting it above the door sill, so to speak (HI).

Thus HSMM WG shot back: "That's simply 'security by obscurity' and not much help!"
So the FCC later withdrew that requirement and changed it to simply record it in the official station log book.

The FCC Enforcement Branch obviously intends that Amateurs have the type of encryption and the key used available if ever there is any question about the nature of the traffic content on a Part 97 network.

Another change? I have stated that when encrypting traffic that your call sign must always be sent "in the clear" (unencrypted). But Walt reminded me that the WG published that as a "good operating practice". It was not stated as an FCC requirement by the Enforcement Branch. Guess I need to review the minutes of the conference again. If true, that is my error, and I regret the mistake!

1186. Re: [ntms-hsmm] Re: Encryption

Yahoo group: DAWG-HSMM
Date: 2008-02-14 03:50:57 UTC
From: Walt DuBose
Topic: 1178 Message: 1186

First, the FCC NEVER SAID or has gone on record saying..."that encryption is allowed if the keys are sent to the FCC or otherwise "published". This came out of talks with the FCC on the meaning of if the intent is to obscure the meaning of the text.

The FCC only pointed to Part 97 where it says that encryption cannot be used to obscure the meaning of the text.

No keys, etc. were communted on.

Now the reasoning for this is quite plain if you look at the wording...encryption can't be used to obscure the meaning of the

Actual verbage..."messages encoded for the purpose of obscuring their meaning, except as otherwise provided herein; "

Its very clear, if you message is encoded for the purpose of obscuring their meaning, its illegal. If you purpose is to NOT obscure their meaning, its Ok.

What so hard about that? Why does it take more explination from the FCC.
The problem is that for years hams have been saying that encoding a message was illegal and it was never that way.

Please understand that discussion with another ham over coffee...even if they are in the FCC are just talk...."how do you feel about encryption on the ham bands Fred? Oh, just look at Part 97... Ok we can encode for control, etc; but, what about the text? Just look at Part 97 Bob."

The ARRL and HSMM WG got the picture. But the FCC never said anything that you could "quote."

To me it was a "hey stupid, can't you read English." Duh... I read them.

I don't have the technical jargon to state this precisely but....it seems to me if a piece of equipment is designed to send a signal a certain way and you don't alter that factory intended purpose then it is not encryption in the sense of trying to alter something so that others cannot interpret it. FCC and others are very capable of reading and understanding anything that a WiFi signal is able to send as standard from factory equipment. Simply if there are other machines/software out there that are designed to read what you are transmitting then you are not trying to hide anything. I believe there are programs that are quite capable of reading/cracking/hacking encrypted transmissions so just exactly how is it that one is actually hiding anything? Keys just make it more difficult for those who are malicious in intent but nothing is impossible. Please forgive me if I am not on track with this message 73 Johnny KD5LWU

Johnny,

You say..."FCC and others are very capable of reading and understanding anything that a WiFi signal is able to send as standard from factory equipment."

I don't believe that this is true.

If you are running WEP128, you create a complex key code...either one that you "think up" or developed from a "pass phrase". Even if the FCC knows the algorythem, you are the only one who knows the key code or pass phrase.

While it is true that many are capable of "breaking" a WEP128 encrypted code, the general public isn't capable of breaking it and I doubt that the FCC employees individuals to do such.

But I have only mentioned a rather simple encryption. There is nothing to prevent individuals from creating a more complicated encryption schemes that would be almost impossible to break without expending a great deal of computer time and effort.

There are commercial "codes" for non-WiFi equipment that operate under Part 15 that are near impossible to decode without great effort. ITT is one of the vendors of encryption equipment that operates under Part 15 that has an encryption code that is equal to the code that the U.S. government uses for Top Secret data encryption...and they have made this equipment for many years.

Walt, Johnny,

My HSMM (k8ocl) node is a good example of this area...

This node has been operating on and off for about 6 years using only WEP64.
In that time dozens of individuals have approached me and said something
along these lines:

"WEP64! Well, I read in DWEEB Magazine that any idiot can break that code!"

My response: "OK, go ahead and break it. If you do I will upgrade everybody
on the network to WEP128."

No takers yet (HI).

As far as I can determine, nobody has intruded on the network to date.
But progress is getting in the way. Some newer PCs will not allow such a
low level encryption, so we may all have to move to WEP128 some day anyway....;o(

Topic: 1178 Message: 1191

The direction and thrust of encryption is to be able to send sensitive data over any network, your network, the public network, and even an enemy's network. For HSMM purposes this brings up more issues than just over the air (OTA) security such as WEP and WPA. Consider what happens if you use SSH, VPN, IPsec or any other secure protocol over amateur networks where the packets are encrypted. This clearly causes the "meaning to be obscured" of the traffic carried and moves the debate from securing of the OTA (over the air) packets to securing the actual content of the communications. I've heard a lot of discussion of OTA encryption and agree that this is probably justifiable under existing Part 97 rules for securing a WiFi network operating under Part 97 rules against improper use by unlicensed individuals. None of us wants a bunch of Part 15 guys invading our fire breathing Field Day wireless network so they can use it for purposes contrary to the Part 97 regulations. The next level of discussion is how to make sure our networks stay legal in a net-enabled world full of VPN, SSH, IPsec and other Information Assurance (IA) techniques embedded in net-centric applications. I for one do not have a good feel for this under Part 97 and would tend to shy away from these things. Yet, in a disaster or EmComm setting, IA becomes essential when protecting lists of casualties and other sensitive information surrounding the incident/event.

One other thought: To make a group of responders effective using WEP or WPA you have to get the keys to those responding to what will be a high stress incident. What is the best mechanism to deliver the keys? One technique is to take a page from the Signal Corps and use something resembling the Communications-Electronics Operating Instructions (CEOI) books with a page of codes changed from time to time and selected by means of some algorithm or a pager code. Thoughts?

Final thing: I am familiar with a public service event that required all amateur operators to be trained in various emergencies that could occur in the event. One of the items was "bomb threat" and there was a procedure for imposing radio silence to prevent accidental triggering of a device by an operator's radio. The "all clear" was a series of code words handed out to every operator on a sheet along with an algorithm for determining which clear code was in force based upon an announcement by net control. Here was a case of "obscuring the meaning" of the communication. Question: Though this plan was both wise and prudent, under Part 97, was it legal?

Gordon-
"To whom at the FCC or NSA would you send your keys and rationale?"
I don't know, but any responsible party should do. Mark it "Attention: Amateur Radio monitor division" or "Attention: Cryptography & Cipher Division" or...use you imagination. Once you've sent it, they're free to misfile it.<G> Proof of mailing is suggested.

Johnny-
FWIW,when you talk about how a piece of equipment was intended to be used consiider this. How many times have ytou heard two hams over the air, and one says to the other "Give me a landline, I want to talk to you about that thing we were talking about yesterday." THAT IS ENCRYPTION FOR THE PURPOSES OF OBSCURING THE MESSAGE. Yes, using analogy is quite sufficient to be encryption, in the general sense of the term. Or, the conventional marathon safety network, where "We need blue water bottles at post seven" will be sent to mean "There's a riot we need police."

Encyrption? Really, the FCC just needs to get off their petards and address the issue. They've got no budget or resources to do it, I can appreiate that. Nevertheless, they are legally obligated to do it--and to do it in plain Ynglitch--and I could give a damn if that means they'd have to furlough everyone and close on December 21st instead of the 31st one year. Or, not address the issue and leave it as it is--which probably will result in a lawsuit one of these days, costing them more than addressing the issue would have.

Walt-
"While it is true that many are capable of "breaking" a WEP128 encrypted code,
the general public isn't capable of breaking it and I doubt that the FCC employees individuals to do such."
Yeah, actually this was discussed in the trade press and the CERT web site about 3 years ago. Any script kiddie can run freeware that is openly available, to break any WEp code that is supplied with any consumer equipment, and the FBI/CERT demonstartion indicates that this only need 3-5 minutes for typical use. WEP is dead, all it does is serve to keep Aunt Rita from looking at the neighbor's computer.
it isn't the FCC's job to break it---it is the NSA's job to monitor,record, and decrypt EVERYTHING "on the air" or "one the wires". But WEP? Ask any grade school geek, he can read it for you.

Thanks guy's for the responsive input. Honestly I have an open network here as there is nothing to hide though all my HDD's are secure (that can be hacked too) and have not really seen a need for much encryption. I really don't mind someone using my WiFi for an internet connection and have not had anyone try to hack me in the 4 years I have been running wireless but then I live in a small town (Cortez, CO - now that I have identified myself I guess I better look out LOL) I do acknowledge the day may come though when more stringent network control will be needed. While I agree that clearer encryption policies are needed from the FCC it might very well stagnate experimentation and of course that is what ham radio is all about.....

Are we perhaps confusing encoding techniques which are used to modulate the data onto transmission media with scrambling for the purposes of hiding one's intents? Modern encoding techniques use data scrambling to maintain a particular density of bits to aid in data recovery at the far end. ISDN and xDSL come immediately to mind as I have worked with them for quite a while.
These scrambling algorithms eventually get published in order to gain a wide audience of acceptance. I don't see this being stifled.

Intentional scrambling to obscure the meaning of what is said can be done in simple plain speech based on a preset list of messages. Nothing hi-tech there. In fact it may even sound like a perfectly normal message. How about reusing 10-codes. Most interpretations are widely published. However, they differ from region to region as to what they actually are.

just my thoughts.

Interesting so one could use a normal sentence structure say "the little brown fox jumped over the moon" and the whole sentence could have a completely different meaning based upon some different formula when reading at the other end. Makes one afraid to talk on the bands - not good to get a letter from FCC for saying something I didn't mean (of course I do that fairly often LOL) Hi Hi got your point though thanks 73 Johnny

From: Steve
Topic: 1178 Message: 1196

Well to me it's a dead issue. But I think the whole point of the "shall not intentionally obscure the message" wording is to stop illegal use of the frequencies. Else it enables business communications and drug trafficking. An obscured message isn't really a problem, what is going on behind that can be.

Anyway for me the whole 1 watt automatic power control rule has to go. Thats my deal breaker. I know the ARRL proposed in March 06 to have that eliminated. Has anyone heard of any progress?

KB9MWR,

The FCC contacted the HSMM WG to advise us that they now consider the 1W APC rule to be unfeasible using 802.11 modulation. The original reg was written on the basis that future Radio Amateur HSMM radio would be CDMA based, not 802.11. With that development it is now considered null and void, both unworkable and unenforceable.

However, the largest constraint is $. The max SS power I have operated is 3W.

Don't worry about it.

73,
John, K8OCL

Well that 1 watt rule is still in Part 97 is it not? That's kind of a stickler, more so that the quote/unquote encryption confusion.

My interest is in a frequency hopping application. Yes as you point out you can walk right around that rule using 802.11g instead of 802.11b.

Steve,

Sorry, I missed your comment in my reply about the unenforced 1W APC thing.
Yes, it is still in the regulations, but the FCC Enforcement Branch wrote the WG
to inform us that they have no intention whatsoever of enforcing it. It was
a bad regulation drafted by well intentioned early HSMM Radio Amateurs and
simply inserted by the FCC into Part 97. Later, when these same Radio Amateurs
tried to revise / eliminate it to reflect the new reality of the situation, the FCC didn't
want to do that (insert and then a year or so later withdraw) so they simply said they
won't enforce it. Hope that helps.

But...

What does 802.11b got to do with FHSS?

802.11 is FHSS.

802.11b is DCSS, while 802.11g is OFDM.

Nothing. I was just saying the 1w APC rule isn't an issue for most as they can use 802.11g instead of b.

I'm not most people. I like frequency hopping, and that rule bothers me. Now these Motorola DTR radios came out, and those are FHSS too.

How is a guy supposed to know when there is an open period for submitting comment on something like that? I've never done that yet, and can see the letter I wrote to the ARRL isn't enough, so I'd gladly comment to the FCC on that if I knew the procedure.

1202. 08 Ham-Com Request for Presentations

Yahoo group: DAWG-HSMM
Date: 2008-03-03 05:09:58 UTC
From: J. Beadles
Topic: 1202 Message: 1202

Ham-Com is being held this year on June 13 & 14 in Plano, TX. The theme of the event is "Not Your Daddy's Ham Radio!". We would like to see an emphasis on is new and modern in every area of the hobby. This can include new features in radios, digital technologies, updated operating practices, and so on. However, if you don't have something with such a link, we still want your presentation.

To submit a presentation for this year's Ham-Com, please visit the presenters' submission form at:

http://www.hamcom.org/cgi-bin/ccp51/cp-app.cgi?&pg=presenters

Be sure to get your presentations in early. Being able to advertise presentations well in advance helps drive attendence. Also, last year we ran out of time slots in the prime presentation hours several weeks in advance, with a total of 100 hrs of presentations!

For more information on Ham-Com, please visit the Ham-Com web site at http://www.hamcom.org/. If you have any questions or need more information, please contact me at n5oom@....

1203. Linux distribution specifically for HSMM and amateur TCP/IP

Yahoo group: DAWG-HSMM
Date: 2008-03-16 07:18:20 UTC
From: kf4yfd
Topic: 1203 Message: 1203

Today Outernet Server, beta 1 was released.

To begin though... what is the Outernet?
The outernet is like the internet, just without the wires.
In short TCP/IP over radio, but easy to use and easy to learn.
At least that is the goal of the project...

It is a custom linux distribution that installs preconfigured and
offers many useful features to an amateur TCP/IP network.

One of its most noteworthy features is automatic FCC identification of
the HAM's that are connected.
See here for a configuration howto on Windows based machines:
http://outernet.wikidot.com/windows-dyndns

The server also acts as an FTP file server, HTTP web server with
bulletin boards, Jabber Instant messaging server, and eventually will
support many more features.

If anyone is interested please check it out and give me some feedback.
This is a "stable" beta. In other words, all features are not finished
but the ones that are should be bug free. Please report any bugs to
the outernet forums.

Interesting article on wifi enabled cameras at:

http://www.pcworld.com/article/id,144462/article.html

Discussion of the Eye-fi SD card, an SD card that contains 2Gb of memory and a wifi radio, so that when you take a pic, it transmits the pic to a predefined Wifi network. It doesn't seem to use FTP or email, though. You can transmit pics directly to your computer if the Eye-fi software is running, leading me to believe that they use a proxy service. Looks interesting. Costs around $100.

From: Mark Thompson
Topic: 1207 Message: 1207

Thomas C. McDermott, N5EG

Dayton Hamvenion Technical Achievement Award: Tom McDermott, N5EG
The Hamvention Technical Achievement Award goes to Thomas C. McDermott, N5EG, for his "more than 20 years of involvement in projects which further the development of Amateur Radio." According to Hamvention, McDemott co-developed the TexNet packet switching network in 1986; based on datagram routing, it covered much of the South Central United States in the 1990s.

McDermott, an ARRL Life Member, received the Doug DeMaw, W1FB, Technical Excellence Award in 2004. Licensed for almost 40 years, he is a member of the IEEE and holds a bachelor's in electrical engineering. His Amateur Radio interests lie in HF digital communications, hardware and software design, and an occasional HF contest.

McDermott was the founder of the Texas Packet Radio Society. As part of that group, he designed the hardware and some of the protocols for the TexNet packet switching network; he has been involved in numerous TAPR http://www.tapr.org/ projects and has written a textbook on wireless communications. McDermott holds eight patents.

We have been using HSMM to network our FD logging operation at GARC. This is not enough for a full presentation but I would be happy to be part of an "HSMM War Stories" discussion where I can gin up a 10 min presentation on our use of HSMM and bring in the gear I use to make it happen. Between Wild Ride and other PSEs there should be enough fodder for a War Stories forum.

I could probably put something together about Plano Balloon Festival. We tied 4 wireless routers together to cover that event. Maximum range was only 2500 feet. But we had some challenging configurations.

We are getting ready to try a 4 mile hop for the 2008 Wild Ride.

You tied the 4 routers "wlan" port together by wireless? Used a different channel for a backbone compared to user access? That sounds like an interesting project -- more details please.

Yes. But we used the same channel for the backbone as for the user access. The off-the-shelf routers do not have the capability of two channels at the same time.

On the otherhand, we could use two routers at each point and have the backbone on one channel, and the users on another channel. We have not tried that, as it is too expensive.

The bandwidth is reduced the way we are doing it, but with 54 Mbps links, most Internet connections are no where near that fast. My FiOS is 5 Mbps Down and 2 Mbps up, and a T1 is 1.4 Mbps. So running at 2% we are still faster than a T1.

Details...
The Plano First United United Methodist church let us use their Internet connection, but their WiFi was on the wrong side of the building, on the first floor. The stone walls and flat roof (with metal underlay) would not let the signal get to us on the roof. We found a place over the wall on the roof where we could pick up their signal as it went through a closet door and an outside glass door. We set up one of the routers as an access point and ran a wire to the side of the roof with one of John's (N5OOM) routers with the 15 db Gain antennas. The 30 degree beamwidth of the antenna was enough to cover all 3 antennas on the field.

The first antenna was at the communications trailer 2500 feet from the church. Since the Communications trailer was metal skinned we ran a CAT5 cable in through a window to a switch for the two computers in there operated by PARK members. The Field Operations tent was about 100 feet off the side, and they were able to connect to the router off a back lobe.

The Second antenna and router was at the scissor lift for the Balloon Flight Director also a PARK member, to get realtime weather reports for flight safety. There was LOS to the Church at about 1850 feet, but there were too many trees to see the communications trailer. I do not remember if the flight director used a wire or his WiFi to attach to that router. Both options were available to him.

The third antenna and router on the field was at the drive way to the field. It was about 1000 feet from the church. The plan there was to have a camera so the field ops could see cars entering and leaving the field. At the last minute we could not get the camera to work, but the link was working.

The network was working from Friday Morning 8:00 to Sunday night about 6:00 p.m.

Our goal next year is to see if we can do the same thing without the directional antenna modified routers. Since the routers were modified they were ham equipment, so only hams could use the network. The Plano Balloon Festival officials wanted to use it also, but could not. If we do it with non modified HW then we could let them hook in also.

Kip

This sounds like a really good idea. Tell you what, if somebody can organize the forum so I don't have to do it, I'll put together some "History of Wild Ride" slides together, and talk about the evolution of WAP11s to WRTs and DSTAR.

That is, somebody else can host and enter the program description.

John,

I plan to work the CQ Magazine booth. Maybe Randy can pull it together.

John, K8OCL "The doctrines of democracy deal with the aspirations of men's souls, butthe application deals with things. One hand in somebody else's pocket andone on your gun, and you are highly civilized...Desire enough for your ownuse only, and you are a heathen. Civilized people have things to show totheir neighbors." Autobiography of Zora Neale Hurston.

1218. 70 and 33 cm WiMAX platform

Yahoo group: DAWG-HSMM
Date: 2008-04-17 21:00:34 UTC
From: danielluechtefeld
Topic: 1218 Message: 1218

FYI.

Telsima has certified a WiMAX platform for operation at 70 and 33 cm (specifically, 400-1000 MHz), with selectable channel widths from 1.5 MHZ to 7 MHz: http://www.telsima.com/index.php?i=84 .

If issues of platform cost and amateur band encryption use can be overcome, this could be a viable platform for some HSMM applications.

Is encryption the same as channel encoding or modulation on the rf side of the box? I hardly regard that as encryption. From a law enforcement perspective (FCC included), there are other ways of gaining intelligence of what is being sent through the unit such as port mirroring to a sniffer device. Port Mirroring (and a court order) is how xDSL is monitored as one cannot tap directly upon the transmission pair(s). Similar things can be done with WiMAX and other modern voice and data transmission systems, if need be.

WiMAX is also an international standard (IEEE802.16/ETSI HyperMAN) with a goal of developing interoperable devices for both providers and consumers. As such, the standard to the channel encoding is published and available through the standards making bodies and trade consortia. Nothing proprietary here except what the chipset vendors (Intel, Motorola, and others) add in to their product to make them standout in their marketspace.

Just my opinion.

http://www.wimax.com/education/faq/faq29

Traffic is encrypted using CCMP, which is implemented using either 3DES or AES.

When implemented using AES, it is very similar to WPA2 employed on WiFi networks.

Therefore, by extension any FCC ruling regarding the use of encryption-enabled WiFi systems would presumably apply to this box as well.

Where hams once chose between voice and CW, a broad range of communication choices now exist. Since the end of WWII, the evolution of amateur HF digital communications has been nothing short of phenomenal. With rapid advances in information technology, new techniques are being developed on a regular basis and more powerful computers find their way into ham stations. Whether you are new to amateur radio or more experienced, you?ll gain an increased understanding of digital communication techniques that will provide you additional
ways to enhance your Amateur Radio experience.

"Hands-on SDR Projects"
The phenomenal Software Defined Radio paradigm shift continues with a significant number of ?off the shelf? as well as amateur hardware offerings. Many programmers are fueling the fire! Come hear the leaders in this movement describe the vast potential of this rapidly advancing technology.
This forum will give an overview of some SDR projects and show you how to get started. Are you are an experimenter or a designer, how can you contribute? Even if you only want to find out what SDR is all about, this forum is for you. Topics will include: Basic SDR architecture, HPSDR project status, useful test equipment, SDR computer hardware requirements, and SDR software.
Speaker
Phil Harman, G3WXO, VK6APH

"Fully Digital HF Radios"
This forum will explain the techniques that are used in a new generation of fully digital HF radios and discuss their advantages, disadvantages and performance in comparison to conventional analogue radios. These new radios digitize the received signal directly at the antenna socket and generate the transmit signal directly in the Power Amplifier.
Speaker
Frank Brickle, AB2KT
"SDR in the Clouds"
This forum will discuss the art and science of designing and implementing a remotable station in the new world of Software Designed Radio.
For a variety of reasons, hams are becoming very interested in using their radios remotely. Typically this means locating the control devices in one place, the radios somewhere else, and possibly the antenna system at some distance from the RF hardware as well. And what a given piece of the system does, corresponds pretty much
exactly to where it's located physically.
With Software Defined Radio, the physical locations are suddenly a lot less important. The functional distribution of system components can be much more flexible. Some of the ?radio? parts can be on one place, other parts elsewhere, or some functions can be completely transposed to a different chunk of the system.
We will cover both theoretical and practical issues involved in building a system that's tailored to different kinds of high-performance requirements, such as multi-multi contesting or weak-signal VHF.
An Atlas Motherboard, and Ozymandias USB computer interface, the basic building blocks of a High Performance Software Defined Radio will be given away as a door prize, at the end of the session. You must be present to win.

1222. AMSAT / TAPR Banquet at Dayton Hamvention

Yahoo group: DAWG-HSMM
Date: 2008-04-18 21:18:38 UTC
From: Mark Thompson
Topic: 1222 Message: 1222

2008 AMSAT / TAPR Banquet at Dayton Hamvention

The second annual joint AMSAT/TAPR Banquet will be held Friday evening, May 16, 2008. The Banquet will be at the Kohler Presidental Banquet Center, Kettering, OH.

Reservations are required and must be made by Monday, 12 May 2008. The price for the Banquet is $25 per person. Tickets can be picked up at the AMSAT booth at Hamvention on Friday, or at the door.

Please contact Martha (martha@...) at the AMSAT office for information or call the office to make reservations. You can reach Martha from 10:00 AM to 6:00 PM EDT at (301) 589-6062 , or in the US toll free at (888) 322-6728 . Presidents Club Gold members should let Martha know if they are attending the banquet.

6:30 PM Doors open and Cash bar is available with Beer, Wine, Liquor and soft drinks.

7:15 PM Buffet Dinner service begins. The Center has a reputation for good food and service. The Banquet will be in the Lincoln or Kennedy room.

MENU
Fresh mixed green salad with assorted dressings
Roast Prime Rib of Beef au jus - carved on site
Marinated Roasted Garlic Rosemary Chicken Breast in lemon butter sauce
Salmon with Newburg sauce
Whipped potatoes
Normandy blended green beans
Fresh fruit bowl
Roll and butter
Coffee/ iced tea/ water
Assorted pies

AMSAT - Dayton 2008
